One word more of caution applicable to the management of convalescence from all exhausting diseases in early life. Too great care cannot be taken that no needless exertion is made, no sudden change of posture permitted, no protracted withdrawal of nourishment allowed even during the hours of sleep. Some years since, I watched a little boy through severe remittent fever; the grave symptoms were at an end, and though the child was extremely weak, convalescence was fairly established. He had restless nights, however, on which account a small dose of Dover's powder was given him towards evening. He slept the better for it, though still waking up, and taking food during the night. On the third night the same dose was again given him, he slept so well that his nurse did not like to disturb him; she lay down beside him and slept too, when morning came he was dead, he had passed away quietly in his sleep. I have never since forgotten the danger, nor omitted to caution the attendants of a child, that they must still be watchful, even when recovery seems most certain.

And now I have enumerated a great variety of circumstances in which sudden death may take place, but yet have not spoken of disease of the nervous centres themselves as tending to its production. I did so advisedly; for in spite of the extreme susceptibility of those organs to disturbance from causes almost numberless, yet it scarcely ever happens that structural changes are discovered in them sufficient to account for sudden death; though, as I scarcely need remind you, actual organic disease of the brain is even more frequent in the child than in the adult. Of twenty-one instances of sudden death which occurred in infants under three years old in the city of Ratisbon, MM. Herich and Popp (b), whose official duty it was to make an examination of all such cases, did not meet with one in which any important morbid appearance was discovered in the brain. For this fact I imagine the two most important reasons are,

1st. That in early life the cerebral vessels have not under-

gone those changes by which, in later years, their coats are rendered brittle, and they are disposed to give way.

2nd. That the unossified skull, while it allows during infancy and early childhood, of a greater fluctuation in the quantity of blood circulating through the brain than is possible when ossification is complete, yet, at the same time, renders such changes far less serious; the yielding *fontanelles* and unclosed sutures allowing of the ready adaptation of the organ to its varying contents. Even the actual effusion of blood into the cavity of the arachnoid seldom causes immediate death, but oftener is the first step in the production of a hydrocephalus which lasts for months or years, a standing illustration of the power of the skull to accommodate itself in early life to great changes in its contents, and of the brain to discharge its functions under conditions which, at first sight, would seem of necessity to preclude their performance.

That most intense congestion too consequent on sun-stroke, of which we see instances now and then even in our temperate clime, generally subsides in the course of a few hours; and oftener than might have been expected it passes away without leaving behind any evidence of abiding mischief having been inflicted on the organ whose circulation had been so rudely disturbed.

Now, from this sketch, very short and very imperfect as I full well know it to be, some lessons of practical value may still be gathered. Of them the chief are,

1st. That in the great majority of instances, when death suddenly befalls the infant or young child, it is an *accident*; it is not a necessary inevitable result of any disease from which it is suffering.

2nd. That the danger of this accident happening may often be foreseen, and that such foresight is not hard to attain by any who will cultivate the habit of minute observation. I read a few days since of how the elephant-hunters in Ceylon (c), when tracking that sagacious beast through its native forests, since on account of his acute sense of smell "it is indispensable to go against the wind in approaching him; when the wind is so still that its direction cannot otherwise be discerned, will suspend the film of a gossamer to determine it, and shape their course accordingly." And so you too will find that things which seem as slight almost as the gossamer film may serve to indicate, to those who watch them well, changes as momentous as those on which depends death or recovery.

3rd and lastly. As small things portend the danger, so small things go far towards warding it off,—food, warmth, posture, quiet; little matters, such as you may think the nurse's office more than yours, are those which over and over again turn the scale upwards or downwards, and many an infant's life has been saved or lost by observing or neglecting points which one is but too apt to lose sight of as utterly beneath the dignity of science.

SALT MEAT FOR THE NAVY.—Mr. Rawlinson says: "There can be no economy in purchasing diseased, and, consequently, unwholesome food. I know the Government advertise for sound meat, and that examinations, as per sample, are made; but I also know that such examinations are necessarily fallacious, and, that, consequently, much unsound meat passes into store, and the crews served with the same suffer in consequence. Government ought to select, kill, and cure all meat required for the public service. There have been many committees of inquiry upon more trivial questions. Let there be an open committee of inquiry on the preserved meats and salt pork and salt beef supplies used in the army and navy, and some startling facts will be revealed which I sincerely hope will induce the Government of this country to abandon for ever the system of contracting for preserved and salted meats."

THE following resolution was passed by the College of Physicians of London on the 21st inst:—"That the President of the College be requested to address to the Council of the Pharmaceutical Society a letter expressive of the high sense which this College entertains of the character of the late Jacob Bell, and of their cordial approval of the proposed scheme to promote the advancement of Pharmaceutical Science, by establishing a Scholarship, to be named after the distinguished founder of the Pharmaceutical Society."

ORIGINAL COMMUNICATIONS.

PAIN AS A SIGN OF DISEASE OF THE STOMACH.

By S. O. HABERSHON, M.D.

Fellow of the Royal College of Physicians; Senior Assistant-Physician and Lecturer on Materia Medica and Therapeutics at Guy's.

As a sign of disease pain is one of very doubtful value: often-times a certain guide to the locality, if not the character of the morbid action; at other times, on the contrary, its presence misleads, or its absence disposes us to under-estimate changes which may be going on in the system. Generally speaking, we find that the mucous membranes, except where they approach the outlets of their respective canals, are free from ordinary sensibility, and may undergo very marked changes in their condition without any painful manifestation. Acute disease may take place in the mucous membrane of the small or large intestine, of the mucous membrane of the kidney or bladder, with complete immunity from suffering. A similar fact is observed in relation to the parenchymatous viscera, the substances of the liver or the kidney, which are often changed in a marked degree, if without much distension, as in abscess of their structure, without any consciousness of it on the part of the patient. On the contrary, in serous membranes an opposite condition is found to be the case: almost any change is appreciated, and in acute or sudden change the pain is often extremely severe in its character. All well know the stabbing pain of pleurisy, the agonising severity of peritonitis, the intense suffering of severe synovitis. In each of these latter diseases rest is a very essential element in the alleviation of the disease, and this rest can be attained to a great extent without the cessation of life. In pericarditis, on the contrary, we find, as for many years shown by Dr. Addison, that there is an absence of pain, unless there be pleurisy occurring at the same time. In the pericardium, however desirable rest may be, movement must continue as long as life lasts. Our object is, however, especially with pain as an indication or non-indication of disease of the stomach, and I think that I cannot do better than submit several propositions, illustrated by the observations of practice and confirmed by examinations after death.

1. Acute, so-called, inflammation and disease of the stomach may be entirely free from pain, if the mucous membrane only be affected. Acute gastritis is generally regarded as an exceedingly rare form of disease, except from irritant poisons. This may be the case; but we are of the opinion, that in many instances the absence of pain has led to this belief. In the gastro-enteritis of children, and not very unfrequently of more advanced life, conditions of great irritability, with cessation of the right functions of the stomach, and probable hyperæmia, must be regarded as closely approaching the character of gastritis. However this may be, we have evidence from the action of irritant poisons, that, while the mucous membrane is only affected by them, pain may be entirely absent, except that consequent on the violent muscular action exerted in the act of repeated vomiting. A few years ago a young woman was taken into Charity Ward of Guy's Hospital, who had taken a large dose of oxalic acid in water. Violent vomiting was produced, failing pulse, and sense of exhaustion; but no pain: and in a few days, after taking demulcent forms of diet, she completely recovered.

In a case of poisoning by dilute sulphuric acid, admitted into Guy's Hospital several years ago, death took place on the eleventh day. There was destruction of the mucous membrane of the lesser curvature and pyloric extremity of the stomach, acute disease of the colon and small intestine. She was a poor woman, affected with melancholia, who took a wine-glassful of the dilute acid before breakfast; a state of collapse existed when she was brought to the Hospital two hours afterwards; there was no corrosion of the mouth, but she could not swallow. In two hours warmth was restored, and she vomited some grumous dark-coloured matter. She continued to vomit blood, and to pass it by stool; and several times the rejected matter contained some sulphuric acid. On the same evening she was able to swallow a little milk and arrow-root, and was

decidedly better. For the next three days she was low, but had no urgent symptoms, and there was no evidence of pain, although she continued to pass blood, and occasionally grumous matter. On October 9th, four days after taking the acid, she swallowed without difficulty; was able to take food; and appeared free from pain, suffering only from dysenteric diarrhœa. No blood was now passed, but shreds of mucus. On the day of her death, she got up and spoke as usual; but in the evening died unexpectedly, no one being present at the time. In this case, the immediate action of the acid upon the mouth and throat produced much suffering; but afterwards, the only symptom was a sense of great exhaustion, feeble failing pulse, but no indication whatever of severe pain, or, in fact, pain at all in the stomach. Although the mucous membrane was very extensively destroyed, the deeper structures were uninjured, and this was probably the reason of the immunity from pain.

An instance of poisoning by a solution of chloride of zinc, Burnett's disinfecting fluid, occurred at Guy's Hospital in December, 1856. There was no pain whatever till eight days before death, when the patient complained of pain at the scrobiculus cordis; she became exceedingly prostrate, haggard and wasted, but continued sensible. She was a domestic servant, aged 37, and twelve weeks before admission, went to visit a friend in the evening, who gave her in mistake for gin three-quarters of a wine-glassful of Burnett's disinfecting fluid. The precise strength was not known. The draught was swallowed; and she at once felt a painful burning in the mouth, and in a quarter of an hour vomiting came on; and purging in half an hour; neither the vomited matters nor evacuations contained any blood; the latter were passed involuntarily. Milk and water were administered. No pain or abdominal tenderness was produced at the time, or at any period prior to admission. I made very particular inquiries on this subject, both from the patient and her friends. She was conveyed home, her hands appeared swollen, and she staggered slightly. She walked upstairs, and undressed herself; the following day she remained in bed, but sat up on the third day, and moved about the house. Vomiting was the only symptom; the ejected matters at first consisted of stringy mucus, and afterwards of bilious fluid; in a few days she washed a floor, and in about a fortnight tried a change of air to endeavour to regain her health; but remained in the same state till admission. There had been dysphagia for a short time, two days after taking the poison; but this symptom did not recur. It appeared to her that the food lodged at the scrobiculus cordis. On admission, she was rather emaciated, not particularly pale, and appeared to possess tolerable strength; the tongue was large, and slightly furred; the pulse compressible; the stomach could only retain food (though of the simplest kind) for a short time; there was no tenderness in the abdomen, which was collapsed; the muscles rather rigid, the lungs and heart were normal; she had no cough, appeared comfortable, and except the vomiting, seemed to have very little ailment. Seven days after admission she began to complain of pain at the scrobiculus cordis, and in eight days more sank completely exhausted. There was ulceration at the lower part of the œsophagus, and also in the stomach, which was much contracted. At the cardiac extremity it was found to be firmly adherent to the spleen and diaphragm; and close to the œsophageal opening was a small pouch, resembling the finger of a glove, and about an inch in length; the extremity of this pouch was perforated, and passed into a cavity containing dirty mucous fluid, situated between the spleen and diaphragm. The mucous membrane of the stomach was destroyed near the œsophageal opening, as well as for about one inch near the pylorus. In the centre of the latter part, the coats of the stomach were destroyed, extravasation being prevented only by the adherent omentum. In the intervening portion, near the lesser curvature, some parts of the membrane were raised, in other parts smooth and firm, and cicatrised, fibrous tissue being found in considerable quantity. The greater curvature was unaffected, the muscular coat much hypertrophied. The lower lobe of the left lung was in a state of red hepatization.

For nearly three months this patient was entirely free from pain at the stomach; and it is highly probable, that the pain which came on eight days before death, occurred when the deeper structures of the stomach were destroyed, and the abscess formed in the left hypochondriac region. If it be stated, that the prostration was the cause of the absence of

pain, this could scarcely apply at the earlier period, when the prostration was not manifest.

We have thus mentioned three instances where pain was absent, or only came on at a late stage; and might instance a similar fact in a case of poisoning by nitric acid, and by arsenic—the former was entirely without pain, and life was destroyed about three months afterwards, from the injury to the mucous membrane of the stomach, but especially from contracted pylorus; in the latter, a sense of soreness, and pain from violent vomiting, were the only appreciable symptoms.

2. Organic disease of the mucous membrane, as for instance, cancer, may be comparatively free from pain.

It frequently happens in cancerous diseases of the liver, that after death tubercles or growths of similar character are observed on the mucous membrane, and of which there had been no indication during life. Isabella D., aged 65, was admitted July, 1855, into Guy's Hospital, with dropsy, apparently arising from cirrhosis of the liver; the symptoms had commenced at the beginning of the year, after exposure, when she had cough, dyspnoea, and burning pain at the stomach; diarrhoea, and great prostration came on, and she gradually sank. The liver was in a state of advanced cirrhosis, which was evidently the cause of the dropsy. Attached to the anterior surface of the stomach, was a large villous growth, but the orifices were perfectly free. After admission this patient did not complain of any pain at all in the stomach, neither had she any vomiting; it is probable that the burning pain she had before admission, was of the character often observed in ordinary dyspepsia, for she was a woman of intemperate habits. The freedom from any obstruction at the orifices, and the growth involving only the mucous membrane, was, we think, the cause of the absence of pain. No supposition was entertained of the presence of this growth in the stomach during life; and it is preserved in the Museum of Guy's Hospital.

3. Disease extending to the muscular or peritoneal coats, produces generally severe pain, as observed in ordinary ulceration or cancer. This symptom is present, as one of the most ordinary signs of the conditions just mentioned, often coming on directly after food has been taken. In several instances, in which the suffering was exceedingly intense, we have found branches of the pneumogastric involved in the thickened densely-fibrous edges of the ulcer. In a case of this kind, which I watched with much interest, the cause of death was gradually increasing exhaustion, as the consequence of the intense pain and constant vomiting. In another instance, recently under my care, of a young woman, aged 21, constant and most severe pain, with progressive emaciation, continued for many months, unrelieved by the administration or application of any anodyne we possess; a month before death symptoms of acute phthisis came on. A large chronic ulcer was found at the lesser curvature, near the pylorus, bounded posteriorly by the pancreas and liver; several branches of the pneumogastric were traced to the edges of the ulcer, and some across its base, only covered by fibrous tissue.

4. Over-distension of the stomach produces severe pain. The formation of the stomach, and its peritoneal attachments, are such as to allow moderate distension in the performance of ordinary digestion; but whenever the distension becomes greatly increased, pain is the result, and it is scarcely necessary to do more than mention this circumstance.

5. Disease, especially of an acute kind affecting the peritoneum, is also, with few exceptions, accompanied by severe pain. When there is peritonitis of the covering of the stomach we very generally have severe vomiting. In reference, however, to the position of pain in peritonitis, it is not always a certain guide to the precise seat of injury. I well remember a case under the care of the late Dr. Golding Bird, in which a young woman was seized with sudden severe pain at the scrobiculus cordis and towards the left side, followed by rapid collapse. From the seat of the pain he was led to diagnose perforation of the stomach; it was, however, found to be perforation of the appendix cæci.

6. Dr. Osborne has shown that in some cases of gastric ulcer the position of greatest ease to the patient may serve as a guide to the exact seat of the disease; that if the ulcer be on the posterior surface, lying on the face would be the most comfortable position, and *vice versa*. Food on its entrance into the stomach generally passes directly along the lesser curvature, and if the viscus be contracted would come in

contact with an ulcer, whether placed on the anterior or posterior aspect of the median line of the curvature. If more distended, there might be less direct application to the diseased surface; and we may mention that in the case of severe suffering just mentioned, the patient appeared to be most easy when leaning somewhat forward and towards the left side, which would have the effect of allowing fluids to gravitate from the ulcer, as mentioned by Dr. Osborne. Disease affecting the anterior surface alone is much more uncommon than on the posterior aspect; and the observation, although of great interest, demands from me further experience before expressing a positive opinion on the subject.

7. In disease of the lesser curvature near the pyloric orifice pain is sometimes experienced by the patient as soon as the food enters the stomach, and in some cases conveys the idea of disease at the œsophageal orifice.

In several instances, where I have afterwards found the lesser curvature only affected near the pylorus, the œsophageal opening being perfectly free, the patient has had this sensation as if food did not enter the stomach; and in one lately under my care, the disease was for many months believed by an eminent Physician to be at the end of the œsophagus. It was the case of T. E., aged 61, an Irishman, married, who in earlier life had been a hawker, and then intemperate in his habits; for nine months prior to March, 1859, he had suffered from difficulty in swallowing, stating that the food did not appear to reach his stomach; the pain was situated at the end of the sternum, and in the back, and was accompanied with a sense of coldness between the shoulders. He very frequently vomited directly after food; after a short time a hard tumour could be felt immediately below the sternum, which became gradually enlarged, and before death there was no doubt that the disease was at the lesser curvature of the stomach. The pain was severe, and almost constant, but the rejection of food occasionally subsided for many days. His death was preceded by an attack of erysipelas, and by vomiting of dark-coloured grumous fluid. On inspection the cancerous ulcer was found close to the pylorus, at the posterior part, and lesser curvature; the œsophagus and the mucous membrane, to within an inch at least of the opening into the stomach, was perfectly free from any apparently morbid state.

8. Many conditions of functional disease are entirely free from pain. It is, indeed, well for us that there is such insensibility, otherwise the least deviation from healthy action might be followed by suffering, and the strict rules of a dyspeptic be essential in ordinary life.

9. The pain in many so-called functional diseases of the stomach is exceedingly severe; but is often produced by a mal-condition of the nerves or nerve centres, and arises from the intimate connection of the spinal and sympathetic nerves. In some states of exhaustion, the whole of the nervous system appears to be in a state of great irritability, and the sensibility of structures become greatly increased. We often find, in these conditions, the stomach incapable of bearing the presence of food; it is at once rejected, or produces intense pain, or flatulent distension is immediately set up, or sense of faintness; and the means best calculated to relieve are those which invigorate and strengthen the whole system. Of this class are the stomach diseases observed in connexion with uterine disease, with loss of blood, mental anxieties, exhaustion, etc.; the deficient nervous supply also interfering, perhaps, with the right secretion of the gastric juice.

10. The effect of diseased condition of the pneumogastric nerve, at its centre or peripheral branches, in connexion with stomach disease is one of great interest, and it is probable that pain is sometimes the result. We have observed severe vomiting more frequently than pain, as produced by irritated pneumogastric: in one case in which a man had received a blow at the back of his head, which produced local meningitis; and a patch of purulent lymph was found close to the commencement of the medulla oblongata, the arachnoid surfaces being closely adherent; so irritable was the stomach, that when he took fluids, I have observed them instantly projected beyond the bottom of his bed.

The irritability of the stomach and occasional pain in supracapsular disease, probably arises from irritation of the branches of the pneumogastric, which pass freely into the capsule, as I have often observed in my dissections of these parts. The dyspepsia of phthisis has been attributed to a similar cause, but probably is as much due to more

general causes of mal-nutrition. Very recently a case was under the care of my friend and colleague, Dr. Barlow, at Guy's, which he kindly asked me to see with him: a man in middle life was several times in the Hospital during four or five years, suffering from severe pain at the stomach and violent vomiting; there was no tenderness, no evidence of gall-stone, or renal calculus, of spinal or cerebral disease, ague, etc.; but a few months ago, after being admitted for one of these attacks, the symptoms of pneumonia came on, and he died. Careful examination of the chest had shown previously no indication of disease. On inspection the whole of the abdominal viscera were perfectly healthy, and although there was no direct proof of cerebral or spinal disease, the sudden supervention of pneumonia was suggested as tending to strengthen the supposition of the pneumogastric centre being the cause of the diseased conditions. It is, however, hypothetical.

11. In many forms of functional disease of the stomach, accompanied with severe pain after food, it is *probable* that extreme irritability of the pyloric orifice exists. We merely state this as a supposition, requiring further examination and observation.

12. In functional, as in organic disease, pain often arises from distension of the stomach, consequent on chemical decomposition of the alimentary mass.

13. The absence of pain is sometimes found in consequence of the destruction of the pneumogastric nerves. This fact was remarkably shown in the case of a man, aged 53, who was admitted, under my care, into Guy's Hospital, in 1856. He had come from the North Foreland; and stated that for six weeks he had had difficulty in swallowing food, pain being produced by the attempt, and solids instantly rejected. The pain was situated at the sternum. On admission he was prostrate, emaciated, and cachectic; he was free from pain, and had never suffered from any pain at the stomach, but had distressing hiccough. He died on the eighth day. The last three inches of the œsophagus were entirely destroyed by a cancerous ulcer; the branches of the pneumogastric were exposed and truncated; food had passed into the posterior mediastinum, had burrowed down through the diaphragm, and formed an abnormal opening into the stomach. The left bronchus was opened by the cancerous ulceration, and other parts were also implicated. At the left apex was a vomica, capable of containing about half an ounce of blood, with a smooth lining, surrounded by iron-grey lung, and in one part firmly calcareous. Mucous *râles* had been heard in every part of the chest during life. The manner in which the branches of the pneumogastric were truncated was apparently the cause of the absence of severe pain in this case throughout its course.

14. Pain at the scrobiculus cordis, simulating disease of the stomach, often arises from spinal disease, the pain being referred to the extremity of the irritated nerve. This fact has often been pointed out, but by no one more forcibly than by the present President of the Medical Society.

15. Severe pain at the scrobiculus cordis is frequently present in chronic bronchitis, obstructive valvular disease of the heart; in fact, any state which leads to over-distension of the cavities on the right side of the heart. In these conditions we very generally find that food produces flatulence, and is very imperfectly digested; the vessels of the stomach and of the whole of the chylo-poiëtic viscera are much engorged; the surface of the stomach is very generally covered over with a thick layer of mucus; but many attribute the almost constant pain at the scrobiculus cordis to the over-filled cavities of the right side of the heart, and to this opinion we are disposed to give our assent.

16. In aneurism of the abdominal aorta we have sometimes observed pain of a most intense kind, and which might very readily have been mistaken for cancerous disease of the stomach, with glandular infiltration, pressing upon the aorta. This severe pain is frequently found in aneurismal disease of the abdominal aorta, especially where the tumour projects anteriorly. In one instance, which I watched with much interest, the aneurism, existing at the position of the celiac axis, was rightly diagnosed, and the patient was exhausted, and died from the intensity of the pain, the false sac not having given way. I dissected large branches of the sympathetic nerve spread out upon the surface of the tumour; and the intense suffering and fatal exhaustion appeared to arise from that implication

of the nerve structures. No other cause of death could be found on very careful inspection.

I have ventured to place these propositions before the Profession; not with the idea that each is established, but rather as guides for further thought and observation.

22, Wimpole-street.

TWO CASES OF RENAL DISEASE.

By JOHN W. GOODWIN, M.D. Cantab.

Physician to the Suffolk General Hospital.

Cases of renal disease are in the present day usually diagnosed without much difficulty, provided we avail ourselves of the great assistance afforded by the microscope, in addition to the other means at our disposal; still I fear that cases not infrequently proceed surely, and without discovery, for a longer or shorter period, in consequence of the masked character of the general symptoms, or because there is an entire absence of some one or other prominent symptom, which usually at once declares to us the presence of the disease. In the two following cases, which have lately come under my notice, I am enabled to furnish an instance of the entire absence of that peculiar symptom so generally present in some stage or other of renal degeneration—namely, dropsy, and also a case of a rather uncommon congenital malformation of the kidneys themselves, co-existing with the renal disease.

All cases presenting peculiarities, either in the symptoms, or in the post-mortem appearances, should be placed on record; and I think that a perusal of the two following cases will not be altogether devoid of interest to some of the readers of this Journal.

Case 1.—Bright's Disease—Hæmaturia Profuse—Amœurosis—Entire Absence of Dropsy—Epileptiform Seizures.

The patient was a gentleman of about 40 years of age, who had been engaged in a laborious business for many years. He was a well-built man, over six feet high, of a nervous temperament, and had suffered from dyspepsia a good deal. Three years previous to the present time (October, 1858) he had an attack of facial paralysis, from which he perfectly recovered. For the last year had been under Medical treatment, and his case was looked upon by his private Medical attendant, and also by a Physician whom he consulted in London, as one of overwork, and nervous debility. He came to be under the care of Mr. Cooper of this town in October, 1858, who formed a most unfavourable view of his case, and on October 10 I was requested to see him, and found him complaining of debility, general pain of a dull character in the head, sickness occurring frequently, and obstinate constipation, the bowels not having been relieved for three days. His sight is considerably impaired, and though at times he sees pretty well, he is at other times perfectly blind. He has a sallow cachectic look, and states that he has suffered from lumbar pains for more than a year, but considered this symptom due to weakness, has had occasion for the last three or four months to pass his water more frequently, and in larger quantities. When Mr. Cooper examined his water first, he considered that there was some evidence of sugar, but of the presence of albumen there was no doubt, and under the microscope I found granular casts of tubes of various sizes, waxy casts—some very large, and others quite small in diameter,—cells with oil, and some free oil and a few blood globules. I suggested for the urgent symptoms of constipation and sickness, drachm doses of mag. sulph., with one drop of Scheele's acid in effervescing mixture every two or three hours, which procured large faecal evacuations, and relieved the sickness and headache after four or five doses. I gave a most unfavourable opinion of his case, and considered it to be one of incurable renal disease. About two days after I first saw him, he had a distinct epileptiform seizure, and he was so prostrated after it, that we had to administer stimulants very freely in order to rally him. He now began to pass blood in very large quantities with his urine, and this continued almost without exception to the day of his death, the urine being very abundant, amounting on one occasion to 120 ounces in the twenty-four hours, the specific gravity 1008, with no very large amount of albumen. We now had the advantage of the opinion of Dr. George Johnson, who took a

most gloomy view of the case, and deemed recovery impossible, in which opinion both Mr. Cooper and myself most fully concurred. He lingered on for about a fortnight from this time; he had good nourishing food, with stimulants; the symptoms continued much the same, the hæmaturia was once slightly restrained by the tinct. ferri mur.; but the constipation and vomiting recurred again and again. His faculties remained clear to the last; but he became perfectly blind for forty-eight hours previous to his death; and this latter event took place exactly three weeks from the date of my first seeing him, and there was never the slightest dropsy or œdema of any part of his body.

A post-mortem examination of the abdomen was permitted, and we found the kidneys enlarged and full of blood; and there were patches of ecchymosis beneath the capsule, which separated easily; small coagula in the pelvis, and calyces of kidneys; and upon scraping the cortical portions a number of small light-coloured granulations were found. The right renal artery was very large, and admitted my little finger easily; but the cause of this dilatation I could not at all make out. A microscopical examination of the kidneys showed the tubes denuded in parts, in others blocked up with coagula and fibrinous deposits; the little granulations contained free oil in abundance, and the renal cells showed oil to be present in them, when cleared up by acetic acid.

Remarks.—With reference to this case I would first call attention to the entire absence of dropsy which was no doubt due to the free secretion of urine continuing throughout; then the presence of hæmaturia to so great an extent is not, as far as I am aware, common in the latter stages of renal disease, and it was suggested by Dr. Johnson that it might be due to the presence of a small oxalate of lime concretion in the kidney, as a few crystals of that substance were observed in the urine. I did not take this view myself, but rather looked upon the condition of the blood itself, as the cause both of this symptom and also of the two other symptoms mentioned, the amaurosis and the epileptiform seizures. We could not find any concretions in the kidneys though they were carefully searched for, and we must therefore, I think, conclude that the renal disease had been going on latently for some time, and thus altering the character of the blood, which alteration was shown by the exudation from the kidneys, the imperfect nourishment of the brain, and the general cachexia which was present.

Case 2.—Renal Disease—Dropsy with Albuminous Urine—Horse-shoe Kidney.

The subject of this case was a little boy, aged 9, and was admitted into the Suffolk General Hospital in September, 1859. He was very pale, feeble in the extreme, and obliged to be lifted about; great general dropsy, in fact, every portion of his body was œdematous, and there was some ascites. Very drowsy, cold, and complained of great thirst. From what I could learn from his father, he had always been a delicate boy, and had suffered much from scrofulous enlargement of glands, bad eyes, etc. Had had scarlet fever about four years previously, and had been exposed to hardship and badly fed. The swelling had only existed about ten days, but he had had very profuse diarrhoea for three days. I had the greatest difficulty in getting any water, but succeeded in getting about an ounce. It became almost solid from albumen when heat was applied. Under the microscope I found in one cell-full a very large number of waxy casts—some of very large diameter, some few granular casts containing a single shrivelled cell, some resplendent granules, and some isolated cells shrivelled up and irregular in shape. Very little could be done for him; a hot bath was tried, but he became so faint that I was obliged to discontinue it; dry-cupping on the loins was also used, and plenty of nourishing broths and stimulants. He gradually became comatose and died four days after admission.

Upon making a post-mortem examination, I found the unusual appearance of the horse-shoe kidney. The two kidneys were lower down than natural, and united across the spine in front of the aorta by a broad band of renal substance, and the whole mass formed a complete horse-shoe, the concavity directed upwards. The outline of the two kidneys was distinctly marked, and the right ureter was bifurcated, one portion from the right kidney, and the other from the central uniting mass. The renal substance was pale both externally, and when a section was made. The

cortical substance had the appearance of very light-coloured beeswax; the medullary portion much darker and well marked. The microscope showed the tubes filled almost universally with an effused material, the result no doubt of a chronic nephritis in a scrofulous subject, this material was exactly the same as the large waxy casts which I had observed in such abundance before death.

Remarks.—This case represents I think the chronic waxy degeneration of Dr. Johnson, and which he represents as at the same time frequently involving the liver. No microscopical examination was made of that organ, but it was pale and enlarged. The coincidence with the disease of the congenital malformation is curious, and I am not aware of any similar case being on record though there may be such. Andral alludes to a case of a single kidney in a state of granular degeneration, but I have not at hand the work of M. Rayer to see whether he refers to any cases similar to my own.

Bury St. Edmunds.

ON DIABETIC CATARACT.

By JOHN F. FRANCE,

Ophthalmic Surgeon to Guy's Hospital, and Lecturer on Ophthalmic Surgery.

WHEN a phase of disease previously unnoticed or disregarded is for the first time brought prominently forward, every fresh instance added to the examples recorded at the outset becomes invested with an interest which, taken alone, it would not possess; because the individual case bears upon the larger question, and confirms or invalidates the conclusions originally advanced. I am on this ground induced to comment on a case of the above-named disease narrated (without any reference to prior researches upon the subject) in the *Medical Times and Gazette* of the 12th inst.; and propose to show in a few words how exact a type it presents of the malady first described by myself in the sixth number of the "Ophthalmic Hospital Reports,"—that for January of the current year.

In the paper alluded to, I summed up the peculiar features of diabetic cataract in the following words:—“(1) The cataracts have in every example been symmetrically developed on both sides. (2) The lenses have increased remarkably in their antero-posterior diameter, so as to encroach upon the depth of the anterior chamber, and even to interfere mechanically with the free play of the iris. (3) The opacity has attacked portions of several strata of the crystalline at once, leaving intermediate spaces for a while transparent. (4) The colour and bulk of the cataracts have invariably indicated their soft consistence, which was proved by operation in two persons, though respectively of ‘middle’ and of forty-eight years of age. (5) The ocular affection has only arisen after a considerable duration of the renal malady (a circumstance which may tend in some degree to account for the comparative rarity of their union); and (6) there has, in no case, been reason to suspect further disease of the eye-ball.”

The recent example just published agrees in every particular, as far as given, with the above characters:—1. “Both eyes were alike” in their morbid appearances. 2. There was “bulging of the iris, apparently pressed by the cataract to a degree that seemed to touch the cornea, which was of full size, and average prominence.” 3. “There was complete lenticular opacity,” for the disease had advanced beyond the point at which its simultaneous origin in separate laminae could be distinguished. 4. The aspect of the cataract before, and its consistence as demonstrated after operation are unfortunately not mentioned; but the greatly augmented bulk of the lens affords the strongest presumption that its consistence was mainly soft. 5. “Eighteen months prior diabetes was developed; five or six months after, the mistiness of incipient cataract came on; but he was able to work at his calling of sailmaking till within eight weeks.” 6. “There was sufficient evidence to show that the rest of the eye was healthy enough to warrant operation.”

Thus this fresh case corresponds accurately with the delineation I have drawn of diabetic cataract; and, coming from an entirely independent source, corroborates, as fully as a single case can do, the reality and distinctive character of this comparatively rare form of disease.

As respects the question of treatment:—The mode of pro-

cedure adopted received the sanction of success. I had, in the paper already quoted, expressed an opinion adverse to extraction in diabetic cataract, owing to the indisposition manifested by the cornea to heal. It is, however, proved by the late instance (and the circumstance imparts great value to the case), that the objection is not of universal application. It is true, indeed, that "the diabetes was decidedly better, as manifested by the less quantity of urine passed, and rather less emaciation;" and I conclude from the mode in which the section was made with a bistoury, that its extent, though ample for the removal of a soft lens, was greatly more limited than in ordinary cases of extraction,—was considerably less, in fact, than a semicircle at the margin of the cornea. But there is satisfactory evidence that at least Gibson's operation (the modern "linear extraction,") may occasionally be practised with safety; and it is hence, perhaps, the most eligible process in these cases, when once useful vision is extinct; provided the general health can be (if only temporarily) brought up to a certain degree of improvement.

I rejoice to find that an invaluable auxiliary in the operation of extraction, which, from experience of its utility, I have been at some pains to advocate in "Guy's Hospital Reports" (a), and the "Ophthalmic Hospital Reports" (b)—viz. the application of forceps to fix the globe, is gaining ground, and was used with effect in the present instance. The more widely this recommendation is tested, the more general, I am satisfied, will its adoption become.

24, Bloomsbury-square.

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

KING'S COLLEGE HOSPITAL.

EXCISION OF THE HEAD OF THE HUMERUS.— GOOD RECOVERY.

(Under the care of Mr. FERGUSON.)

For the following particulars we are indebted to Mr. Mason, the House-Surgeon having charge of the patient.

M. A., aged 46, was admitted in October last. She is married, and states that she has always had good health up to about eighteen years ago, when she fancied that she had got rheumatism in her right shoulder; the usual remedies were applied, but the pain continued. Four years after this, an abscess formed at the back of her shoulder, which was punctured, and a great quantity of pus evacuated. Other abscesses formed in the region of the neck, but the pain did not appear to diminish in any way. Thus she continued, sometimes better, sometimes worse, until last Christmas, when she noticed a tumour, about the size of an orange, in front of the shoulder-joint, and another above the clavicle. She applied for advice at a Metropolitan Hospital; and the tumour proving to be an abscess, was lanced, and its purulent contents let out; the pain in the region of the joint, however, increased in severity, and blisters, iodine, setons, and various other applications were used without any benefit being derived.

On admission, she was a healthy-looking woman, but had a somewhat anxious expression of countenance. On examining the right arm, two or three sinuses were found at about the anterior border of the deltoid, and one sinus at the back of the arm, about four inches below the acromion: a probe introduced detected bare bone; manipulation caused great pain, and the joint seemed ankylosed, the limb being completely useless to her. Mr. Fergusson, on October 29, determined to examine the part more carefully, and the patient having been placed under the influence of chloroform, an incision of about four inches was made, commencing just below the acromion process in front, and proceeding in a downward direction. Mr. Fergusson now discovered that the disease was far more extensive than he had at first anticipated, and on making a closer examination, found the whole of the joint disorganised; he therefore made an incision an inch in length outwards at right angles to, and at each end of the first; with a little manipulation the head of the bone was

turned out, sawn off, and the glenoid cavity having been found diseased, was gouged to remove the necrosed portions, and the parts were brought into apposition, silver-wire sutures being used to unite the cut edges of the wound. There was some little hæmorrhage from a vessel which Mr. Fergusson believed to be the posterior circumflex artery; this was, however, easily arrested. Since the operation the patient has not had a single bad symptom, the functions of the body having been in a perfectly healthy condition. At the present time (November 19, three weeks after the operation), the wound looks remarkably well, and has all but healed; the patient is able to move the arm slightly, and without pain, and says she was never better in her life.

ST. BARTHOLOMEW'S HOSPITAL.

LITHOTOMY.—REMOVAL OF THE MIDDLE LOBE OF THE PROSTATE.

On Saturday last Mr. Paget removed a calculus from a cachectic man past the middle period of life. Considerable difficulty was experienced in removing the stone, but it was at length accomplished; a projecting part of the prostate being removed at the same time. The patient had suffered from symptoms of stone for two years, and had had great pain. Mr. Paget stated that the question of lithotomy had been raised, but on account of the man's state of health, and of his not having that amount of intelligence which is desirable in those undergoing this form of operation, lithotomy had been preferred. He remarked that, as was seen in the course of the operation, the projection from the prostate would have presented an insuperable obstacle to lithotomy. In reference to the operation, Mr. Paget stated that there was no unusual difficulty until the attempt at seizure of the stone. This at first seemed almost impossible. The forceps would follow and touch but would not grasp, and at length (apparently the only possible mode in which it could be accomplished) the removal was effected by the intervening obstacle, the enlarged mass of the prostate, being at the same time removed. Mr. Paget exhibited the calculus and the part removed with it. He said that it might not look well to remove part of the prostate, but it was unavoidable; and this instance was not a solitary one. It involved no increased risk. In a patient from whom a similar piece had been removed in St. Bartholomew's, a recovery had followed without any inconvenience. There was also a specimen in the Museum of the Hospital in which the third lobe had been removed; the patient had an easy recovery. He referred to a case of lithotomy in which Mr. Fergusson intentionally removed part of the prostate by the knife after the completion of the operation, with the view of relieving the patient of what would probably cause him subsequent inconvenience.

THE LONDON AND ST. BARTHOLOMEW'S HOSPITALS.

CASE OF KELOID IN THE CICATRIX OF A BURN.

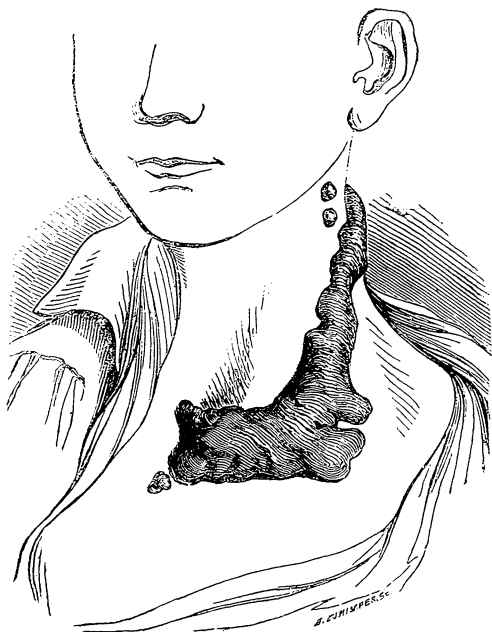

There is a certain peculiar form of the disease, known as Keloid, which occurs in the cicatrices of burns. Several examples of it have come under our notice at different times; one such, we well recollect to have seen many years ago, under the care of Professor Laycock (now of Edinburgh), at the York Dispensary, in which it occurred in a boy, and consisted of an elevated red mass about the size of the palm of the hand, and was situated on the abdomen. Its subjects are, we believe almost always children; but this may, perhaps, be partially accounted for by the fact that the greater proportion of severe burns occur in such. The appearance usually presented is as if a large mass of fungating granulations had skinned over, and become consolidated. The margins of the affected patch are abrupt, and the diseased structure is very firm to the touch, the depth of the latter being, in most cases which we have observed, from a quarter to half-an-inch. We believe that this form of Keloid has, after a certain time, but little tendency to grow, and we cannot help suspecting that its mode of production is some-

(a) Third series, vol. iv. 1858.

(b) April, 1859.

times in conformity with its *primæ facie* appearance, and that it results from inattention to the condition of the sore during the later periods of cicatrization. Everyone of much experience in the treatment of burns in children, must be aware that at a certain stage there often occurs a most remarkable tendency to the production of prominent fungating granulations. In many cases the utmost attention on the part of the Surgeon in the persevering use of caustics, desiccants, or pressure, is necessary to secure a sound and flat scar.

The following is the history of a well-characterised example of this form of keloid. The patient, a boy, aged 13, is now under the care of Mr. Skey, in St. Bartholomew's Hospital. He was formerly under the care of Mr. Gowlland, at the Islington Dispensary. He was at that time a boy of somewhat strumous appearance. The accident, a scald, from upsetting a teapot, occurred about five years ago, in August, 1854. The hot water ran over the face, ear, and chest, and also a little at the back of the neck. The scalded parts, which afterwards became the seat of the keloid, were six or seven weeks in healing, and during the healing there was a great discharge of very offensive matter. A white ointment was applied, and the granulations were rubbed over with nitrate of silver and sulphate of copper. It did, however, heal completely, and was quite well for some time previous to the appearance of the keloid, which, when first seen, had been growing ten months. It commenced with a most intolerable itching, "as if creepers were under the skin." The tumour was hard, tough, raised, and irregular at its edges, and extended from the ear along the side of the neck. There was no other special ailment, though the boy's general constitutional powers were not good. Mr. Gowlland gave him cod-liver oil and tonics; but no improvement following, he was taken to the London Hospital as an in-patient under Mr. Curling. When admitted the tumour presented the appearance and relative size exhibited in the annexed engraving. Collodion was tried, but no benefit followed, except slight contraction and flattening. Pressure by a spring was next tried, but this was of no avail. Mr. Curling removed two isolated portions from the upper part of the mass. There was a great deal

of hæmorrhage. The parts healed, but the growths returned exactly in the same positions. Mr. Curling, after consultation, determined not to attempt any further operative measures. The boy was discharged.

He was recently admitted under the care of Mr. Skey, into St. Bartholomew's Hospital. The tumour then presented the same general appearance that it did three years ago. It seemed, however, to have extended more on the sternum. Four weeks ago, Mr. Skey removed the upper part of the tumour, and a fortnight later a piece lower down. There was again considerable hæmorrhage. Mr. Skey made some remarks on

the mode of operating for the removal of such tumours. He commenced with an instrument fashioned generally like a bone-nipper with edges, but not sharp, the object being to arrive at the same ends as by the *écraseur*, and not risk hæmorrhage, and also at the same time not leaving a large, ulcerating and unhealthy sore. This instrument, however, proved too small, and was therefore exchanged for the scalpel, when the hæmorrhage alluded to occurred. The mouth of a small vessel was found in the removed mass, probably that of a vein. The patient is now doing well. We hope to be able at some future period to report the result of this operation as regards recurrence.

We are indebted for the above particulars in part to Mr. Gowlland, and in part to Mr. Harle, of Islington, under whose observation the boy had formerly been. The woodcut is from a drawing by Mr. Gowlland, made three years ago.

THE PROVINCIAL PRACTICE OF MEDICINE AND SURGERY.

LIVERPOOL SOUTH DISPENSARY.

OBSCURE CASE OF PHLEGMASIA DOLENS (WITH PYÆMIA) IN ITS EARLY STAGES SIMULATING RHEUMATIC FEVER.

(Under the care of Mr. J. M. BENNETT.)

M. C., aged 27 years, of a scrofulous diathesis, and nervous temperament, visited at her own dwelling February 21, 1859. It was stated that she had been confined nine days previously, that the lochia were plentiful, that she had suffered from diarrhœa for three days, and that she had been entirely deprived of rest in consequence of pains of an acute character over the right elbow, shoulder, and wrist; her pulse was full and bounding; cheeks flushed; headache; profuse sour-smelling perspiration; tongue covered with white thick fur, except at the tip and edges. She told me that she had suffered from rheumatic fever some time previously, and that the same joints were affected. She now attributed her disease to the effects of cold, caused by a window being left open two nights before. As the diarrhœa was the most urgent symptom in her case I ordered a mixture, composed of 3ij. conf. arom.; 3ij. tr. opii; 5j. potassæ chlor., and mist. camph., to ʒviij.

Feb. 22.—I found her in much the same state as yesterday; there did not seem to be any abatement in the pain or diarrhœa. Ordered a pill composed of gr. 1½ calomel, and ½ gr. of opium every fourth hour.

23rd.—She seemed somewhat relieved from the diarrhœa, but the bright flush which I had previously noticed over the joints of the right upper extremity suddenly made its appearance in those of the left side. As she complained of great thirst, and expressed a desire for something sour, I ordered her lemon-juice, diluted in large quantities.

24th.—I was sorry to see my patient so much worse. She was quite delirious, the redness over the joints having become of a deeper colour, and also manifested itself in one of the lower extremities, viz., the left knee; the lochia, which up to this date were described as being plentiful, ceased. Retention of urine also was present, and I found it necessary to pass the catheter twice to-day; ordered the simple diaphoretic mixture of the Dispensary, and the abdomen to be well stuped with turpentine fomentations, in the hope of restoring the suddenly arrested excretion.

25th.—On my visit I was much struck with the patients' anxious expression of countenance, her skin having a peculiar earthy hue. The left knee seemed to be the principal centre of her sufferings. On examining it carefully, I felt convinced that matter was forming within the joint. There was, however, not the slightest symptom of rigor, nor yet was there tenderness in any part of the limb, except in the immediate vicinity of the joint. The metacarpo-phalangeal articulation of the right index finger was much swollen and discoloured. I also fancied I could detect matter within its boundaries. As she seemed in a very low state, I ordered her some wine, and half-grain doses of opium every three hours to obtain rest.

26th.—I found that the opium had succeeded in procuring sleep, but the redness and swelling of the left knee had altered their character, and become that of phlegmonous erysipelas. What on the day previously had appeared confined to the neighbourhood of the joint now seemed diffused over a large extent of surface. I thought it advisable to have the opinion of my colleague, Mr. Lyster, who, after examining the case very minutely, came to the conclusion that it was one of phlegmasia dolens of a very obscure form. Free incisions had to be made in the left leg and at each side of the knee-joint, also over the right elbow and metacarpophalangeal articulations. There seemed to be every symptom of infiltration of pus into the right lung. Night sweats and hectic flush supervened, sinuses formed along the crest of the left tibia, which were of a truly strumous appearance; bed-sores formed, and large sloughs separated from the parts injured by pressure. The evacuations were constantly mixed with blood, and also that which had the appearance of pus. Tonics, stimulants, and vegetable astringents were persisted in, together with cod-liver oil, which was, curious to say, retained in the stomach when everything else was rejected, and I was happy to see, much to my surprise, improvement take place when I feared rapid dissolution. The night sweats and loss of appetite first disappeared, together with the hectic flush, the diarrhoea being the last to succumb.

The bed-sores quickly healed, and my patient each day regained strength; the left knee, however, for the space of two months remaining contracted in a manner which only admitted of her placing the point of the great toe to the ground; this, the last of the train of her sufferings, has vanished, and left her once more quite strong and able to follow her domestic duties, the metacarpophalangeal articulation being the only joint which remains permanently injured.

Although strictly bearing in mind the remarks of Dr. Watson that phlegmasia oftentimes commences like rheumatic fever, I still think, from the history of the case, that three separate diseases may have been at work to produce the results which were established: latent scrofula, of which herself and all her family seem to be heirs; the rheumatic fever, of which she had heretofore been the victim; and the blood-poisoning, of which there can be little doubt when matter has appeared almost simultaneously in so many joints. Was this pyæmia caused by active inflammation? I believe it was; that this was of a specific form, occasioned by the rheumatism attacking the fibrous tissues of the uterus, thereby causing an unhealthy action of its lining membrane, and a subsequent taking up of its viscid contents by the sinuses. The extreme rapidity with which strength was regained can only be accounted for by considering it as the result of a total elimination of the morbid poison which, in my mind, seems to be a power inherent to scrofulous habits, as exemplified in most febrile diseases, and even those of a chronic character, syphilis alone being excepted. I plead the truly debilitated appearance of my patient for not having used more vigorous measures at an earlier period of my attendance. I had known the family and seen scrofula exhibited in so many phases amongst them, that Nature was almost left to work her own cure, which she has most nobly done.

FLOGGING FROM A GERMAN POINT OF VIEW.—In the *Allgemein Med. Zeit.* an anonymous writer condemns the bastinado as a punishment for three reasons:—1. Because it is in every case prejudicial to the integrity of the body, producing, with the pain it occasions, symptoms of inflammation, etc.; in other terms, corporal punishment is a corporal lesion. 2. And even in granting that this punishment does not produce a lesion, it is impossible to say in any case beforehand that it will not do so. 3. In a moral point of view it is inexcusable, because it cannot be applied except under the empire of passion and of necessity: and if it is pronounced by the judge from this point of view, it proves either that there are among those who are under the jurisdiction of the State, individuals who are on the same scale of intellect as unreasoning animals, or that *employés* are not to be found who have the qualities and force necessary to deal with malefactors without employing this punishment. Of course, in speaking of the bastinado, he includes the cat-o'-nine tails, and the knout.

NOTES AND QUERIES.

He that questioneth much shall learn much.—Bacon.

No. 387.—A KILLING MAN.

The following epigram on Sir Izaak Pennington, the fashionable "ladies' doctor" of the day, is attributed to Archdeacon Wrangham:—

"When Pennington for female ills indites
Not caring *what*, but only *how*, he writes,
The ladies,—while his graceful form they scan
Cry, with ill-omened rapture, 'Killing man!'"

No. 388.—THE "FELL" TREATMENT.

SIR,—My query regarding the value of Dr. Fell's "cure" of cancer seems to have attracted considerable attention, if I may judge from the numerous letters that have flowed into your columns in consequence thereof. But it seems not to have been duly apprehended that the object of my query was rather to obtain brief summaries of the results of a large number of cases, than any lengthened detailed accounts of individual ones. If any gentlemen cognisant of results of these cases would confine their communications (directed "to the care of the Editor of the *Medical Times*,") to filling up the subjoined schedule, ample information for all statistical purposes would be obtained, and many Medical men, who might have neither the time nor the inclination to report cases in detail in your columns, might still with little trouble to themselves, afford very valuable data for the investigation of the subject in question. I am, &c. F.R.C.S.

November 18, 1859.

Sex.
Age.
Organ affected.
Stage of disease.
Date of commencement of Dr. Fell's treatment.
Duration of treatment.
Was the treatment attended with pain?
Date of recurrence of disease.
Final result of treatment.

No. 389.—MEDICAL TRACT BY MARAT.

The infamous Marat appears to have been once in Edinburgh and also to have been the author of a tract entitled "An Enquiry into the Nature, Cause, and Cure of a Singular Disease of the Eyes, hitherto unknown and yet common, produced by the use of certain Mercurial Preparations. By J. P. Marat, M.D. London, etc." At the end is a note which mentions his having been "at Edinburgh last August (1775)." The concluding paragraph is worth quoting, as showing how a man could write like a philanthropist, and afterwards act like a monster—

"If we cannot always be the happy instrument of alleviating the misery of the unfortunate, it is however, a sort of service tendered to them, to prevent their being made worse."

Marat does not figure as a medical writer in Dezeimeri's Dict. Hist., and in the Biograph Univ. no mention is made of this medical tract; but Marat's residence in Edinburgh is briefly mentioned, and the "Chains of Slavery," and also several treatises on electricity are attributed to him. In the medical tract the subject of electricity is again alluded to.

No. 390.—RELIQS OF THE PLAGUE OF LONDON.

A few weeks since the workmen in digging out the foundation on the east end of Three Nuns-Court, by St. Michael's Church, Aldgate, came to a considerable quantity—upwards of a cartload—of human skulls and bones about seven feet from the surface. In some of the papers it has been conjectured that they formed part of the sweepings of some adjacent churchyard after the fire of London. This was more likely the great pit or "dreadful gulf," as De Foe calls it provided for the parishes of Aldgate and Whitechapel, which, during a fortnight after it was opened, had thrown into it 1,114 bodies, when they were obliged to fill it up. De Foe adds, "I doubt not but there may be some ancient persons alive in the parish who are better able to show in what part of the churchyard the pit lay than I can; the mark of it also was many years to be seen in the churchyard, the surface lying in

length, parallel with the passage which goes by the west wall of the churchyard out of Houndsditch, and turns again into Whitechapel, coming out near the Three Nuns Inn."

No. 391.—PROVERBS AND SAYINGS ON DOCTORS' DOINGS.

"If the Doctor cures, the sun sees it; if he kills, the earth hides it." "The earth covers the mistakes of the Physician." "Bleed him, and purge him; if he dies, bury him." "The Doctor is often more to be feared than the disease."—*Italian, French, Spanish.* Sir W. Hamilton said: "Medicine in the hands in which it is vulgarly dispensed is a curse to humanity rather than a blessing." Sir Astley Cooper avowed: "The science of Medicine was founded on conjecture, and improved by murder." "The Doctor seldom takes physic," says the Italian. The German wit writes: "Physic does good always, if not to the patient, at least to the Apothecary." The Spaniard tells: "It is God that cures, and the Doctor gets the money;" and "if you have a friend who is a Doctor, take off your hat to him, and send him to the house of your enemy."—*Proverbs of all Nations.*

No. 392.—THE PUZZLED DOCTOR.

"The Seranes," Borden writes, "father and son, were Physicians of the Hospital at Montpellier. The son was a lively theorist, who knew by heart and was continually repeating all the written documents about inflammation, just as children repeat in their silly way: 'The grasshopper has chirruped all the summer, etc.;' or, 'Mr. Crow sits perched on a tree, etc.' Serane, the father, was a good soul, who had studied under great masters. He had learned to treat fluxions of the chest with emetics, giving them at least every second day, with or without the addition of two ounces of manna; they were his great *chevaux de bataille*. I have seen him fire them off a thousand times, everywhere and to everyone. The son resolved to convert his father to the fashion of the day; that is to say, to inspire him with a salutary dread of *phlogosis, erethismus*, and the rupture of the small vessels. The good father consequently fell into a most singular kind of indecision: he knew not how to act. However, he held out firmly against bleeding; and when he came to a patient, he would murmur awhile, and then pass on without ordering anything. I have frequently known him apostrophise his son with earnestness, and to cry out, when he was desirous but yet afraid of administering an emetic: 'My son, you have ruined me (*Mon fil, m'abès gastat*)!' Never shall I forget this curious scene. I am greatly indebted to it, and so also were the patients of the Hospital. They got well without being bled, because old Serane did not like the bleeding, and without taking emetics, because young Serane had proved to his father that these remedies increased inflammation. The patients got well, and I learnt a profitable lesson. I concluded that the numerous bleedings with Seranes, the son, practised, when alone, were at least as useless as the repeated emetics to which Seranes, the father, was so much attached."

ANSWERS.

No. 384.—HARVEY'S PORTRAIT.

In the last number of the *Medical Times and Gazette* there is an inquiry about the portrait of Harvey. Two are well known; one by Cornelius Jansen, at the Collège of Physicians; the other by Bommel, once in the possession of Dr. Mead, and afterwards in that of Dr. Richard Bright. Opinions will, in the usual way, vary as to which picture would furnish the most popular engraving. My own vote is in favour of that by Bommel; for these reasons. The painting by Jansen was emphatically an office-portrait representing Harvey in the robes of the President of the Collège. It is true he was elected President, but he declined accepting office on account of age and infirmity. This happened, and of course the portrait was painted, less than three years before his death, at the age of 80. The portrait by Bommel, is, I believe, of an earlier date, and simply gives us the anatomical discoverer, and philosophical physiologist. Harvey's fame rests on this basis. The public and the Profession revere the memory of the great man; and if the Presidentship is made too much of, will be apt to ask why the Collège deferred to do honour to its most illustrious member till he had numbered his seventy-seven years, and the grasshopper was a burden, and desire failed, and the wheel was well nigh broken at the cistern.

SATURDAY, NOVEMBER 26.

DR. SMETHURST AND MISS LÉONIE CHEREAU.

Our neighbours across the Channel have lately, like ourselves, suffered under the infliction of a "celebrated case." Theirs, however, has been happily of a less tragical kind than ours. We refer to it, because equally in both of these trials we cannot think that the science of Medicine has shone out brightly. On the contrary, we fear that in both countries there will be left on the mind of the public, doubts and misgivings as to the dicta of the Profession, when it has again to be heard in Courts of Justice on great occasions. The ball has already been set rolling in this direction by Sir C. Lewis himself, and as we venture to think, most improperly. He has evidently in the document of doubts and difficulties through which free pardon is proclaimed for Dr. Smethurst, thrown a stone or two at the Doctors, in order to cast off from his own shoulders the odium of a protracted hesitation. Dr. Smethurst is pardoned; and there is the last word which Justice has to say in his case. We cannot, however, help noticing as a fitting and proper conclusion to the whole of this enormous scandal, and evident miscarriage of justice—whether guilt or innocence be implied—the closing scene of the judicial machinery. It was left at last for Sir B. Brodie to decide whether the prisoner was or was not guilty! Jury, Judge, Home Secretary—all the paraphernalia of our high and powerful law—were, admittedly, unequal to the task of unravelling this mighty mystery. After careful judicial inquiry and judgment given, a second investigation is established, and wise men of science are called in to enlighten our Home Secretary's deciding powers. In vain. Indecision reigns, and holds the mind enthralled for weeks and months; but still an issue must be come at. And now it is—the knot being found too strong for the Secretary's fingers to loose—that a deity worthy to untie it is called upon the stage. No more fit or proper man than Sir B. Brodie, we know, could be found for the labour of attending upon the delivery of our Home Secretary. His long and intimate acquaintance with poisons and their actions, his numerous experiments in this direction, and his vast experience and matured judgment,—all these pointed him out as the man, if any, fitted to solve the gordian tie. This we freely admit; but we, as members of society, cannot but ask—Is it not most passing strange that such a turn should be given to the criminal law of this country? Is not the precedent thus set utterly adverse to the principles of our law, and one of a most unpardonably dangerous nature? Has it ever before been heard of in the annals of justice here, that after a solemn judicial investigation, and judgment given, a man of science has been called in to revise, con over, consider, value, and weigh the whole materials of the case, and pronounce sentence? We shall be told that the whole history of this affair is remarkable and unsatisfactory—exordium and peroration; and that it was only fitting that its conclusion should be like

all its other parts. Sir C. Lewis, however, may as well know that his unfair singling out of the Medical Profession for reprobation as a scapegrace for himself to ride off upon, is a piece of gratuitous and wanton impertinence which does not go down with the public. He will discover, that in general opinion he himself cuts no particularly fine figure in this protracted drama. Some *Mauvais Plaisants* have even likened him to the astute animal which died of inanition, through prowling over-long between the equally-poised bundles of hay. Some surprise has been expressed that Sir Benjamin Brodie's letter has not been published. It is understood that Sir Benjamin has no objection to its publication, but the Home Secretary "does not feel justified" in consenting to it. This, again, is strange in a country where all legal proceedings are public, and the Star Chamber is a thing of the past.

In the French case above alluded to, the well-known M. Tardieu and Dr. d'Olive are the Medical divinities; who appear, just as those well-known Homeric invisibilities did of old, at the right moment, to throw a cloud around their favourite and save him from his peril. A girl, Léonie Chéreau, not yet seventeen years old, is arraigned for having stolen a child of M. Hua, a Judge of the Civil Tribunal. Of course she was a good-looking girl, trembled nervously, was elegantly dressed, having on a green velvet mantle, trimmed with black lace, black silk dress and veil, etc. It came out that she had been seduced by George Prieur, on his promising to marry her; but, as is the usual way in such misadventures, he refused to fulfil his promise. Hereon, she says she is *enceinte* by him; and, after some preamble, produces *la piece justificative*, in the shape of a child. This child was the child of Judge Hua, and she had stolen it from its nurse in the garden of the Tuilleries, in a most artful manner: having thoroughly humbugged the garrulous old lady, and persuaded her to leave the child for a short time under Léonie's charge. On the nurse's return, Miss Chéreau and the child had disappeared. The case against the young lady was most clearly made out—in fact, she herself admitted the abstraction of the child. But now came the turn of her defence. Let elegantly-dressed and good-looking young females never despair for an excuse. Our cold, calculating, strong-headed northern countrymen were subdued by the charms of a celebrated Miss Madeline Smith; and who then can be surprised if our impulsive and vivacious neighbours found guilt, in such a form as that of Miss Chéreau, a thing impossible?

"Dr. d'Olive and Dr. Tardieu, who had been charged to make a Medical examination of the girl, stated that she was of an exceedingly nervous temperament, and subject to the malady called hysteria, and that though that malady had not affected her mental faculties, it was not impossible but that in the circumstances in which she had been placed it might have so influenced her imagination as to cause her to suppose that she was *enceinte*."

This was her first door of escape; though what it had to do with the charge of child-stealing does not appear clear. Then came an eloquent appeal from counsel, who insisted that she stole the child to save her honour, and yet that she was in such a state of high nervous excitement as to be unconscious of what she did, and, therefore, unaccountable for her doings. "Look," he said, "at this letter, written by her. Is it possible that any one not highly morbid in sentiment, and excited by the yearnings of a great love, and overwhelmed by grief at her melancholy position, could have penned such an epistle? The very writing of this letter proves the upset condition of her mind. How could she in her natural faculties have so described her passions?"

Once again that cold-blooded functionary, the Public Prosecutor, energetically supported the indictment, and insisted that the prisoner could not be acquitted of so grave a crime, so clearly proved, without danger to society. "What have you to say in your defence?" says the President, before com-

mencing his summing up. "She rose with painful effort, and said faintly, 'I ask pardon of M. and Madame Hu!'"

But neither President's balanced justice voice nor Public Prosecutor's energy can touch the Jury's reason; for their sentiment is all engaged for Léonie, and *not guilty* is their answer to the majesty of law. The Jury felt that the mind which could have penned that exalted letter must have been temporarily unstrung, and therefore temporarily irresponsible.

"The prisoner, on hearing the sentence, was completely overcome with emotion, and the gendarmes had to carry her out of court."

Such would have been the end of this remarkable case, had not that best of jokers—the *Churivari*—taken up the psychological side of the question; and announced, for the benefit of Judge and Jury, and Public Prosecutor, that the letter—the exaltedly-expressed sentiments of Léonie—which so proved her disturbed mind and her innocence—was a downright copy, word for word, of an epistle to be found in that highly moral bantling of Dumas fils,—*La Dame aux Camélias*!—the original version of the "Traviata" of little Piccolomini.

Such are the conclusions of these two famous dramas; and thus has been announced the innocence of Dr. Smethurst and Miss Léonie Chéreau! Let Justice clap her hands for joy!

THE WEEK.

WE direct especial attention to an advertisement published in another part of this Number, in order that qualified persons who are still unregistered (those especially who have obtained their qualifications in the course of the present year) may not lose their opportunity of appearing in the General Register for 1860.

The Arts of Peace do not flourish amain by the side of the Arts of War. The sounds of preparations for some great looming event now too fully occupy the minds of men to allow them calmly to lay the scheme of a new Exhibition of the Industry of all Nations. We are not, therefore, surprised to learn that the Council of the Society of Arts have resolved to put off the repetition of the Exhibition of 1851 to 1862. Who can tell where the goddess *Industria* may be at that date?

A country doctor in Belgium prescribes *santonine* for a child troubled with worms. The child takes the powder, and in a few hours dies horribly convulsed. On analysis, it was found that five-sixths of this *santonine* consisted of *strychnia*. Justice then intervenes, and discovers that the warehouse from whence the doctor got his drugs is in a state of deplorable confusion, poisons being mixed with other matters, and the sale of things being entrusted to a most ignorant assistant. The only fault of the doctor, it seems, was this: that he had not, according to law, analysed and verified the purity of the drugs he received into his pharmacy. Justice therefore decrees: a month's prison to the druggist, and 200 francs fine and half the expenses; to his shopman, 15 day's prison, and 100 francs fine and a fourth of the expenses; and to the doctor, the smallest penalty, viz., 50 francs and one-fourth of the expenses.

"*Caveant consules*," writes a Medical French alarmist. Things unnatural are going on around us. In the heavens and on the earth, in the air and in the waters, he sees fearful prognostications. That vast lurid redness seen in the North indicates no good; and the serious perturbations of the electric wires affright him. One evening he observed around the

moon an immense circle, which he regarded with amazement. The long and tropical heats of the past summer are evil signs. Springs have dried up, some waters have been spoiled; and trees stripped of their leaves before the appointed time, their fruit destroyed, and their most beautiful flowers covered with parasites, the return of the oïdium, and the fungus of the apple—all are to him most sad events. Moreover, the general health is seriously affected. Never, says he, was diarrhœa so widely spread; death from dysentery is great; in one commune alone, during the months of July and August, 37 infants were lost out of a population of 1500. From the north, the south, and the west, he tells us, we are threatened with an invasion of the Asiatic scourge; and there are appearances as though the yellow fever may arrive from the West Indies. The plague of Benghazi is also near the gates of Marseilles.

Abdul-Medjidh, though a very moderate ruler, has an excellent idea of the value of physic. In a late tour through his provinces he picked up a fever, and very happily so for his doctor, Caratheodory. A few doses of sulphate of quinine appear to have put the Imperial patient on his legs again, and so relieved the tremblings of an anxious list of court hangers-on. Now, it appears, that when the Sultan is proclaimed convalescent after an illness, it is the custom for all the members of the Imperial family, for all the high dignitaries and functionaries, to make the presiding Medical genius a present. Of course the degree of these gentlemen's joy is measured by the size of their present; and the joy being very great on the occasion in question, Dr. Caratheodory has come in for some three or four hundred thousand francs worth of jewels, objects of art, and presents of all kinds. Then comes the Sultan's turn, and for his fee he gives the Doctor a magnificent domain. It would seem to be only among demi-civilized and savage nations that the doctor receives proper respect. However, there may be a reverse to the medal even here; for we are not told what M. Caratheodory's fee would have been if his affectionate friends had lost their beloved master Abdul! All the world cried out against M. Lallemand when he charged Ibrahim Pacha 200,000 francs for an operation on the urethra; but it is clear that Lallemand understood the ways of Orientals.

It appears not to be generally known that the Examination for the Indian Medical Service will take place on the 12th December next, instead of in January, 1860. If gentlemen intending to become candidates have not seen the advertisements issued some months ago, this notice may save them from missing the examination altogether. About twenty-five appointments will be given away in December.

An important decision in Medical law has been made in the case of Phillips v. Bugg. This case recently came before Mr. Leigh Trafford, judge of the County-court at Birmingham. The plaintiff summoned the defendant for £1, as his Professional charges for attending on the occasion of a fatal accident, which had happened through the misadventure of the person sued. The defendant's attorney questioned the plaintiff respecting his being a Surgeon, and whether his name, as such, was upon the Medical Register. The plaintiff produced a receipt for £2, which he said had been paid for the insertion of his qualification in the Medical Register, but he had no copy in Court of the published document itself. Thereupon an adjournment was made to a subsequent day, when the same gentleman again appeared as plaintiff in another case, where he sought to recover £5 3s. 6d. for medicine and attendances upon a patient who had been

attacked by Asiatic cholera. In this instance the plaintiff was cross-examined regarding the medicine sent, and the several visits he paid to the sick person, while the other side further contended the plaintiff had only proved he possessed a licence to practise as an Apothecary, but not as a Surgeon; consequently, he became unable in law to enforce fees for attendances; and, therefore, could only charge for medicines furnished. The judge, however, held that the plaintiff was legally empowered to charge as well for medicine as also attendances; and he accordingly pronounced judgment in his favour. This decision, unless overruled by a superior tribunal, would imply that legally-qualified Apothecaries can henceforward charge both for the remedies supplied to patients, and for visits made professionally.

A correspondence has lately taken place between the Council of the Medical Association of Ireland and the Irish Poor-Law Commissioners on the subject of the dismissal from office of Dr. Wall, the Medical officer of the Dumanway Union Workhouse. It appears that Dr. Wall had been guilty of conduct which, on the harshest interpretation, could only amount to an error in judgment, in reference to a case of comminuted fracture of a very dangerous character. For this error he has been punished by dismissal, being, moreover, disqualified, by a sealed order from the Commissioners, from holding any other office in a Poor-Law Union. The Council of the Medical Association of Ireland, deeming the punishment quite disproportionate to the offence, ventured, through Dr. T. L. Whistler, the Chairman of the Council of the West Medical Association, to address a remonstrance to the Irish Poor-Law Commissioners, setting forth the great hardship of Dr. Wall's case, and praying for a revision of the sentence against him or for further inquiry into the merits of the case. To this memorial the Irish Commissioners have sent what we cannot but regard as a most insolent and contemptuous reply; not only refusing all redress to Dr. Wall, but taking Dr. Whistler to task for interfering in a matter in which, the Commissioners allege, he has no concern. We should imagine that any Medical Practitioner stepping forward in aid of an oppressed Professional brother, would be treated at least with decent civility and attention, but such is not the opinion of the Irish Poor-Law Commissioners, who seem to regard all fraternity of the Medical Profession as an invasion of their own rights and privileges, and arrogate to themselves the power of exercising the severest measures of authority without any control or supervision whatever.

Mr. Hutchinson has been elected Assistant-Surgeon to the London Hospital. The vacancy was caused by the resignation of Mr. Wordsworth. The candidates were originally three: Mr. Couper, Mr. Hutchinson, and Mr. Sharman. The first and the last held office as Demonstrators of Anatomy in the London Hospital Medical School. Mr. Couper did not, we understand, intend to enter into a contest, coming forward rather with a view to the next vacancy, but Mr. Sharman continued in active competition until within a few days of the day fixed for the election. Mr. Hutchinson had, we believe, the almost unanimous support of the House Committee, and of the Medical and Surgical Staff of the Hospital.

The Practitioners of Dudley, who forwarded a protest to the Council of the College of Surgeons (which we published in our number of November 12), have sent us the following reply. We said the case was one requiring explanation. An explanation is now given; but it is one which will satisfy nobody. It is quite clear that the Court have shown a want of caution, which, if not corrected, must be followed by the most

lamentable consequences to the whole Profession. It cannot be tolerated that a Druggist, and an Assistant, who have never attended a Lecture, or entered an Hospital, should be admitted to the same privileges as men who have won their position by years of hard work. We are glad to hear that a Special Committee of the London Medical Registration Association has been summoned to take into consideration this act of the College. If such conduct be persisted in, the Medical Council will be called upon to bring the conduct of the erring Board before the Privy Council.

Royal College of Surgeons, London, W.C.
11th day of November, 1859.

SIR,—Your letter, with its enclosures, has been laid before the Court of Examiners, and I am desired to acquaint you, that, owing to the highly penal clauses of the Medical Act this College has, in common with several of the Medical Corporations in the United Kingdom, been obliged to relax its rules for a limited period, in favour of certain persons who have practised many years, and who, in the opinion of the Court, would have been unjustly excluded from the Register; and has admitted to examination persons whose Surgical and general character has been certified by competent Practitioners, in which category the Court considered both Mr. Horton and Mr. Meredith to be included.

I am, Sir, your most obedient Servant,
EDMUND BELFOUR, Secretary.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

SUCCESSFUL OPERATION FOR IMPERFORATE ANUS.

By Professor THIRY.

THE author was called to a strong male child twenty-four hours after its birth. Not the slightest trace of an anal aperture could be perceived, and the case had begun to assume a very serious aspect. By a happy chance, while the child was being turned round, a greenish matter, which proved to be meconium, was seen to issue from the urethra, indicating doubtless that the rectum terminated in the posterior wall of the bladder. A small catheter was at once introduced into the bladder, and by slight pressure engaged within the rectum, as was proved by the discharged meconium at its other extremity. The catheter was now raised gently towards the walls of the abdomen, so as to induce a projection towards the perineal region. This was not sufficient to reach the skin, from which the catheter continued separated by full a centimetre and a-half; and it was not deemed right to increase the depression lest laceration might be induced. A linear incision full two centimetres long, was now made at the proper point for the anal orifice; and after carefully dissecting away the tissues to a centimetre and a half in depth, the catheter was reached. The intestine was divided to the same extent as the skin, and meconium mixed with blood flowed out, no hæmorrhage having occurred during the operation. The catheter was next turned so as to bring its concavity towards the wound, and its extremity was carried right through the incision to the exterior. To this a large tent of charpie, well greased, was attached, which, on the withdrawal of the catheter, occupied the whole track of the wound to the wound of the intestine, the thread attaching it being brought out through the bladder and urethra. In this way, the wound could be dressed when desired, the flow of matters was favoured, and infiltration was prevented.

We need not pursue the progress of the case day by day; but it will suffice to say that, the tent, at first changed three times a-day, and increased in size, was by the end of a week introduced by means of a *porte-mèche* instead of by the thread passing through the urethra, which was removed. Good suppuration had been established, abundant faecal matters were discharged, and no infiltration had taken place. Six weeks after, the child in the meantime having gone on satisfactorily, the author was sent for, because the faecal matters were discharged with difficulty, and had begun to reappear again by

the urethra. The new anus was, in fact, found to have become considerably narrowed. Both the orifice and the artificial canal were freely incised, and to prevent a future closure a small dilating instrument, much resembling a *speculum ani*, was daily introduced, and expanded considerably more than was necessary for the mere passage of the matters. For six or eight months this practice was steadily persevered in, the dilatation being gradually at last diminished. It is now nearly four years since this operation was performed, and the child has continued quite well, passing his faeces in the proper amount for a child of his age, and *not suffering from incontinence*. Occasionally, however, faecal matters are passed with the urine when constipation is present. The anal aperture is rounded in form, and plaited as in the normal condition.—*Presse Médicale Belge*, No. 20.

EXCERPTA MINORA.

Creosote in Panaris.—M. Turchetti states that as soon as the inhabitants of the province of Garfagnano perceive the first appearance of this painful affection, they apply to the finger a small piece of linen rag moistened in creosote. This is followed by intense pain which lasts nearly a quarter of an hour, after which the tumefaction and pain gradually subside, the course of the panaris having been cut short.—*Union Méd.* No. 135.

Injection of the Sulphate of Atropine in the Track of the Pneumogastric Nerve in Asthma.—The last Paris novelty consists in this treatment, by M. Courty, of the paroxysms of asthma in a case which had resisted a great variety of medicinal agents. He injected along the track of the pneumogastric nerve, on the inner side of the sterno-cleido-mastoïdeus and on a level with the thyroid cartilage six drops of a solution of the sulphate of atropine, which produced vertigo, dilatation of pupil and other symptoms of narcotisation. Next day the injection was repeated on the other side, and thrown in more deeply, with the effect of producing still greater, though not alarming narcotism. A third injection, two days after the last, completed the treatment—the asthma having gradually diminished, and now, four days after the first injection, entirely ceased. The patient (a lady, aged 54) continued quite well two months after the treatment had been put into force.—*Moniteur des Sciences*, No. 37.

Tannin in Albuminous Anasarca.—M. Garnier thus concludes a paper, strongly recommending tannin in albuminous anasarca, independent of Bright's disease, as, when consecutive to scarlatina, etc., 1. Tannin given in quantities of from $\frac{3}{4}$ to $\frac{5}{8}$ per diem, relieves passive œdema or anasarca, coinciding with albuminous urine. 2. Its curative agency is manifested by an increase in the quantity of urine, which also gradually resumes its physiological properties, increased transpiration, greater freedom of alvine evacuation, return of appetite, etc. 3. These signs of improvement may commence from the second day after the administration. 4. Given in solution, doses of from four to eight grains of tannin do not cause disturbance of the digestive organs. 5. Its action seems to be primarily exerted upon the liquids of the economy, coagulating and plastifying their albuminous principles. Its action upon the solids seems to be consecutive, tonic, and astringent.—*Archives Gén.* Tome xiii. p. 35.

Action of Alcohol upon the Economy.—According to the usually-received opinion, alcohol introduced into the circulation by absorption from the alimentary canal, becomes rapidly destroyed by combustion with the oxygen of respiration. Carbonic acid and water may be the immediate results; or, as is more generally admitted, the alcohol passes through a series of transformations, representing derivatives more and more oxygenated, as aldehyde, acetic acid, oxalic acid, and finally, carbonic acid. The results of a series of experiments instituted by MM. Duroy, Lallemand, and Perrin, point to different conclusions. According to these, alcohol is not destroyed in the blood, since it may be found in all the liquids and the tissues, while the products of combustion are not found there; and, moreover, it is eliminated by the various channels, as the lungs, the skin, and especially the kidneys. They conclude—1. That alcohol is not an alimentary substance, it acting only as a modifier of the nervous system; 2. It is neither destroyed or transformed in the economy; 3. It becomes especially concentrated in the liver and in the brain. 4. These facts explain the production of certain

organic and functional changes in the liver, brain, and kidneys.—*Gaz. Méd.* No. 46.

Citric Acid in Acute Rheumatism.—Dr. Hartung states that this substance acts more efficaciously than lemon-juice in acute rheumatism. He forms a mixture with six drachms dissolved in five ounces of water, and sweetened with two ounces of syrup. This is to be taken in from fifteen to thirty-six hours, the patient also drinking as much cold water as he pleases, and the parts being wrapped in wadding. Of forty-five cases of acute rheumatism, some of them very bad ones, so treated, in two only was the result not satisfactory. Sometimes, even after twenty-four hours of treatment, there is a notable diminution in the pain and fever, although in most cases from two to three days are required to produce this amendment. The remedy does not induce diarrhoea, and it favours transpiration.—*Gaz. des Hôp.* No. 134.

GENERAL CORRESPONDENCE.

INDIAN MEDICAL SERVICE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Looking over your files, my attention has been attracted to your remarks on July 23, respecting the relative attractions of the British and Indian Medical Services, and as I consider them likely to mislead candidates in estimating the respective advantages of the two Departments, I beg to submit the following remarks on their comparative merits, estimated as a means of livelihood.

The Indian Service is superior as regards pay, prospects of emolument, rewards for professional superiority in skill or scientific knowledge, furlough, early retirement, certainty of promotion, pension, and provision for widows and children. It is inferior solely as regards enforced residence in a climate which may be adverse to a particular constitution, and in having no home appointments; also in its scanty provision for retirement at an earlier date than after seventeen years' service in India; in other words in having no half-pay, properly so-called, on which officers can be temporarily placed.

1. *Pay.*—The Indian Assistant-Surgeon receives £25 12s. per mensem as a minimum, and is certain in the course of two or three years to fall into charge of some corps, or to obtain some civil Medical employment, when his income may be raised even to £100 a-month, and will certainly be from £40 to £50. The talk about the necessary expenses in India is, for the most part, nonsense; an economist can live on £15 a-month, and no subaltern (bachelor) has any business to spend more than £20. The unnecessary expenses of India are anything you like to make them. The Army Assistant-Surgeon receives £15 a-month nominally, but deducting income-tax, mess, and band fees, is considerably less. In India, or three other stations (China, Ceylon, and Mauritius), he receives allowances which raise his pay to about the minimum of an Indian Assistant; but elsewhere he receives nothing worth mentioning, and has only an increase of eighteen pence (!) per diem to look for till promoted.

2. The Indian officer has innumerable Professional appointments open to him, from a Medical Professorship at the Presidency, with its lucrative practice, downwards. Let a candidate take up the latest "Quarterly Army List" of any of the Presidencies, and look down the list of the Medical Department for the occupations of each member, then let him take the Almanac and Directory of each Presidency, and look in the salary-tables of the staff and civil appointments for the rewards attached. He will find that an Assistant-Surgeon may draw from £1000 to £1500 a-year of pay and allowances. I know several who do so, nay, I have known an Assistant-Surgeon in the receipt of £5000 a year; true, he owed great part of it to his own talents, but what did he not owe to the service that opened such a field for them? The Army Medical officer has nothing of all this open to him, except a little private practice in a few colonies, where, if he is a man of talent, sufficient to counterbalance the superior advantages possessed by the settled civil Practitioners, he may realise, perhaps, a few hundreds a-year at the utmost. If he fall into a civil appointment of five shillings a-day as Health-officer, or Port-Surgeon, he may think himself lucky.

3. Rewards for Professional skill or scientific knowledge abound in India. Any really good man is certain to be noticed, and if his superiority should lie in the practical exercise of his Profession, care will be taken to give a field for its display, whenever opportunity offers. If, on the other hand, his forte should lie in botany, geology, chemistry, etc., he will be marked for office in the Presidency Colleges, or for the charge of botanic or tea-gardens, or woods and forests, or geological survey. All these things pay well too. Few such staff salaries are under from £30 to £50 a-month, and this in addition always to regular pay proper. The Army service has nothing of all this to offer even for specialities, and as for rewarding purely Professional merit, such a thing is never thought of. Military Medical merit—that is soldiering as much as possible—is the great qualification for advancement in the Army department I observe. The object of its officers seems not to be reputation as skilful Doctors, but as brave soldiers.

4. *Furlough.*—It is difficult to say too much in praise of the Indian rules on this head—granting three years' leave of absence at a spell. The British officer rarely gets more than as many months, unless sent home by a Medical Board, when six months' leave is considered extremely liberal, even after ten or fifteen years' service in India. Again,

5. As regards retirement, what a boon it is to be able at 39 years of age, to command one's freedom with an independence (limited, it is true, but still sufficient for a bachelor,) of nearly £200 a-year? with the certainty of an ultimate considerable increase from the operation of the Medical Fund, an invaluable institution, the benefits of which seem to have been altogether overlooked in your remarks of 23rd July;—£200 a-year at 39 years of age is far more valuable to a Medical man than £300 a-year at 47. Few will dispute this. If this early retirement is granted in consideration of the seventeen years of service being spent in the tropics, may not the British officers justly complain that no allowance is ever made to them for exactly similar service? How many of them spend twenty years, or even more, in the tropics?

6. Certainty of Promotion may be regarded as the Palladium of the Indian service; never to be forfeited except by proved incapacity, which, when it exists, is never unknown, and only needs due moral courage on the part of the executive to render the system of seniority promotion by far the best adapted for a Medical Service, where age and experience must, *ceteris paribus*, give weight to the opinions of an Elder.

The system of brevet promotion in the Indian Service, which you object to, is one of its best features, and the great regret of all who understand the subject is that it does not go far enough. All men cannot be fortunate enough to share in campaigns, or to be at hand when opportunities of personal distinction are available. Some must be in Burmah when the scene of combat lies in Seinde; but yet they are there in obedience to orders, and doing a much more disagreeable duty in the dysenteric tents on the Irawaddy, than their comrades who are galloping after Beloochees from Jacobabad. The Indian rules do not allow of the one class being robbed of their hard-earned promotion to reward the other, wisely ordaining that Professional steps should be gained by Professional service, but they admit of honorary rank and military decorations as the just recompence of field service, at which no one can murmur; and to qualify the candidates for the latter, they bestow the former. But why the Assistant-Surgeons alone should be eligible for the grant of increased rank for meritorious deeds, no one can fathom. It appears to have been an oversight in both services, not to have made Surgeons eligible for Surgeon-Majorities in like case, and not to have allowed the latter grade to be gained by a certain number of years' service in the rank of Surgeon, as well as by twenty years' total service. For want of this latter provision, an Assistant-Surgeon promoted for gallantry to the rank of Surgeon at an early date, will find himself ultimately beneath the men he passed over at first.

At present, Surgeons have no promotion to hope for; as Deputy-Inspectors in the Royal service will seldom leave a vacancy, and in all probability may be yet relatively fewer in the British than in the Indian Service, as the number in the latter is fortunately fixed, while the economic reaction which must come will lop them down in Whitehall.

In conclusion, let me now draw your attention to the admirable provision possessed by the Indian Medical Service, in their Widow and Orphan Funds, securing to their families

not the mere rescue from absolute beggary which the Royal bounty provides, but respectable incomes of some hundreds a-year, according to rank, subscription, etc. The youngest Indian Assistant-Surgeon can thus assure his widow about £200 a-year. The British officer's widow receives nothing unless her husband has served ten years, or been killed, and then only £50.

Now against all these relative advantages, there is to be "written off," slower promotion, and the necessity of serving in India. Well, as regards the first, it is only of late that such disparity existed, and for very many years the Indian service had much the advantage. Little more than twenty years ago, the Army assistants were men not far from fifty when promoted! Now they are worn out, and unfit even to be Surgeons at fifty-five!! Promotion is now very rare, and ere long may be as slow as in India.

The retiring allowance of Indian officers early disabled is certainly too small; but then it is theirs for life, however healthy they may afterwards become, whereas the English officer's is only temporary and certain to be forfeited on a restoration to health, if he declines to serve; while all his time on half-pay, even by reduction, is not allowed to reckon in any way.

The cases of Indian officers shelved so early are very few indeed, so few that no healthy candidate need take the chance into consideration, while if he lives for twenty-five years, and is commonly prudent, he will find himself in England under very different circumstances from the numerous old British Surgeons of long standing, lately turned adrift without ceremony, on a pittance of £320 a-year, most of whom never had an opportunity of saving anything like half what their Indian brother will receive from his fund.

I say then to all candidates, "Go to India if you have the chance." I am, &c. EMERITUS.

DEATH FROM CHLOROFORM AT THE LONDON HOSPITAL.

LETTER FROM MR. TODD.

[To the Editor of the Medical Times and Gazette.]

SIR,—In the Hospital Reports of your last Number, you detail a case of death from chloroform, which I think bears out my theory that chloroform should be administered in a gradual manner, at first highly diluted with air, and then by degrees stronger and stronger, until the patient is under its anæsthetic influence. It is not the quantity of chloroform which kills, it is the effect it has in producing spasm of the glottis, heart and lungs, when the vapour is given in too concentrated a form, before the nerves have become accustomed to it. In most of the cases of death from chloroform, only very little is said to have been used, and I can quite understand it. I can readily believe that one single inhalation of over-strong vapour may be sufficient in some people to cause death, just as a moderately large dose of laudanum may kill a man, whereas if that man had become accustomed to it by having taken several doses, commencing with a small quantity and gradually increasing, he might have taken double that dose with impunity. But why, Sir, people will persist in giving chloroform from a piece of lint when that mode of administration has caused so many deaths, I cannot imagine.

I am, &c.

ARMSTRONG TODD.

16, Old Burlington-street,
Nov. 20, 1859.

PROPOSITION TO RAISE PROFESSIONAL FEES.—The Medical and Pharmaceutical Association of the Department of the Somme at its last general meeting, came to the following resolutions:—"Considering that all the necessities of life have long since undergone an increase in price, while Medical fees have remained stationary; and seeing that the mere number of visits paid does not constitute a sufficient element for fixing the amount of fees, which should also bear relation to the gravity of the disease, the importance of the operation, the danger incurred by the Practitioner, and other circumstances, such as the social position, and means of the patient—be it resolved that in future Practitioners have a right to a higher remuneration, and that this remuneration shall not be dependent upon the number of visits paid, but also upon the above-named considerations."

REPORTS OF SOCIETIES.

THE EPIDEMIOLOGICAL SOCIETY.

MONDAY, NOVEMBER 8.

DR. BABINGTON, President, in the Chair.

AFTER the usual preliminary business of the Meeting, Dr. BABINGTON opened the Session 1859—60 by an Address, in the course of which he introduced an interesting *resumé* of the principal epidemics which had appeared in various parts of the world during the last twelve months, drawn up by Dr. McWilliam, the Secretary of the Society. Cholera, we learn, broke out in July last at Bombay and Poona, and almost simultaneously on the continent of Europe, selecting on this, as on former occasions, the city of Hamburg as the scene of its development. It next appeared at Helsingfors, in the Gulf of Finland, and afterwards in Southern Sweden, and early in September it declared itself in Stockholm, the capital of the kingdom. While cholera was prevailing in these Northern latitudes, its appearance was also announced at Murcia, which is situated in the south-eastern part of Spain. The disease, however, soon abated in the town; but it lingers still on the coast, as Alicante and Valentia are still considered as ports suspected of cholera. More recently the disease had attacked Rotterdam and Bruges, at which latter place its progress was for some time most alarming. There was not, it appeared, any very satisfactory or trustworthy information with reference to the origin of the disease in any of the Continental ports; but it was well known that in the course of the past summer and autumn cholera had been imported into several of the ports of this country by vessels from Hamburg, viz.—the river Thames, in two different vessels; Hull, Grimsby, Southampton, and North Shields. In the last-named port, the disease was communicated to a lodging-house on shore, when it proved fatal to two of the inmates. From the time that the existence of cholera was known, our Government appear to have been fully alive to the necessity of taking measures against the invasion of this country by that scourge. Quarantine restriction was not resorted to, nor was the freedom of commerce or of intercourse with other countries at all interfered with, but every precaution short of these was taken by the authorities. All arrivals in the ports of this country, more especially in those having intercourse with Hamburg, were carefully watched for cholera cases; and in those vessels where the disease did exist, a certain degree of isolation from other ships, and of limitation of intercourse with the shore, but not such as to cause inconvenience, were recommended and in all cases followed. The sick sailors brought into the Thames were at once transferred to the *Dreadnought*, and, had occasion required, Cholera Hospitals were ready for immediate use. The local authorities at such ports were exhorted to provide places of reception for poor passengers and seamen who might arrive suffering from cholera. They were also furnished with the admirable provisional memorandum, drawn up by Mr. Simon, which earnestly urges upon local authorities the immediate and energetic exercise of the powers conferred on them by the Nuisance Removal Act, during the prevalence of cholera, diarrhoea, diphtheria, typhus, or any other kind of fever, and which also contains concise and clear suggestions for the prevention and mitigation of these and other epidemic disorders. Diarrhoea was unusually fatal in London during the past summer, and a death from cholera was occasionally to be found in the Reports of the Registrar-General. Partial outbreaks of cholera, as on the banks of the Itchen, near Southampton, were said to have occurred in some of the country districts; but nowhere in this country, except at Wick, in Caithness, and at Glass Houghton, in the parish of Castleford, near Pontefract, had the disease appeared in an epidemic form. In the West Indies, yellow fever had been prevalent at several of the islands, more especially at Antigua, Trinidad, and St. Thomas. In the *La Plata*, which arrived last week at Southampton from St. Thomas, there had been fifteen deaths from yellow fever during the passage home. Much remained to be done in the way of improving military barracks in the West Indies and, indeed, a thorough and

minute inspection of all barracks in these islands seemed absolutely necessary, if we intend to put an end to, or at all events to mitigate, the evils of every-day occurrence in that part of our colonial possessions. Scarlatina and diphtheria had prevailed in most parts of this country, more especially in the rural districts. Diphtheria had also appeared in Australia. The origin and progress of this disease in a country like Australia, which had all along enjoyed a comparative exemption from epidemics, were subjects worthy of careful investigation. Allusion was next made to the Permanent Public Health Act, which was happily carried through Parliament during last session. Among other important objects obtained with this Act, was the placing of the Public Vaccination of England and Wales, under Medical Supervision. The regulations for the necessary staff were most anxiously expected, and would, it was to be hoped, enable this country to realise to a far greater extent than it had yet done, the benefit conferred by the magnificent discovery of Jenner. For its sins of omission in this respect, England was at this moment being scourged. The great small-pox epidemic which commenced in 1857, had, within the last twelve months, had possession of this metropolis, within the limits of which scarcely less than one thousand persons have paid in this period by death, and probably ten times that amount by sickness, the penalty of their neglect of, or of the imperfect manner in which they have received the great prophylactic of Vaccination. Dr. Babington concluded his address by exhorting the members to zeal, in furnishing papers for the Society and in regular attendance at the meetings.

Dr. RICHARDSON read a paper

ON ZYMOSIS.

He first considered the process of fermentation as it occurs out of the body. He dwelt on the different views which have been held as to the nature of this process, explaining that they divided themselves into three groups: the vital, the physical, and the chemical. In regard to zymosis, or ferment *in* the body, the view generally held was linked with the idea of the vital character of the fermentation process. Having at some length sustained these positions, the author passed on to observe on the objections which might be urged against the vital hypothesis, and then presented a reading of the subject which, resting on a basis purely chemical, explained much that was obscure and conflicting. He (the author) did not oppose the idea of zymosis; on the contrary, he gave to it a direct affirmative, but he argued in reference to three points,—1st, That the virus exciting the fermentation was simply an albuminous product. 2nd, That the virus was not by its presence the cause of the symptoms, but that the symptoms of the epidemics or zymotics were due to the presence of new chemical products, resulting from the new chemical changes. 3rd, That the re-appearance in some cases of the virus as an excrete was a necessary result, but that the origin of the virus was purely local. Dr. Richardson next passed on to show that if the views he had advanced were tenable, they would explain many points which otherwise were all in confusion, would link certain diseases to the zymotici which are not at this moment ranged in that list, and would yet, at the same time, reduce the verbal list of zymotics to a few units. In the first place, he urged the theory of zymosis, as he explained it disclosed the reason of the analogy which exists between diseases acknowledged to be communicable, and certain other diseases which are not considered communicable, such as dissecting-room cholera. In the next place, it explained the reason why a small, equally with a large quantity of poison introduced into the body, excites the same intensity of effect. Thirdly, the theory suggests an alliance between diseases arising from the absorption of poisons, and diseases produced by changes occurring in the body spontaneously, such as rheumatic fever and tetanus. Fourthly, it explains why the majority of zymotic diseases get well of themselves. If the poisons of these diseases were vital and increased or multiplied in the body, the reproduction would last so long as the material for the continuance of the reproduction were present. But if the process were simply chemical, as he supposed, there is a direct reason why the diseases ran a limited course, inasmuch as chemical changes having no independent continuance when their causes are removed, cease necessarily after a time, together with the symptoms excited

by them during the period of their operation. Lastly, on the theory suggested by the author, an immense field was opened for direct experimental inquiry. Here scientific researches might take two directions—the one towards tracing the action of known poisons on animals, and exciting diseases analogous to the zymotic diseases after the synthetical method;—the other, by ascertaining whether diseases so excited could be transferred to subjects previously unaffected. The point which attracted most interest in the paper was that which had reference to tetanus. This disease Dr. Richardson claimed to be essentially zymotic. His theory of its production in traumatic cases, is that the wound in the process of healing secretes a special albuminous product, which has the property of a ferment. This substance absorbed into the body excites new chemical changes, and as a product of these, there is developed an alkaline or alkaloidal substance, having properties analogous to strychnine. Whether the patient shall or shall not recover depends, therefore, on the circumstance of this produced poison being or not being eliminated from the system by the excretions, before the tetanic symptoms excited have progressed to a certain degree. If the symptoms are extended, or are moderate, or are moderated by medicinal means, the poison may be eliminated, and the patient may recover, or the reverse. In regard to tetanus two experimental questions were open for solution; viz. Will the secretion from a wound in a tetanic patient, introduced by another wound into a healthy animal, excite tetanus? Secondly, Are the excretions, say the urine of a tetanic patient, capable, like strychnine in solution, of exciting tetanic spasm in a susceptible animal?

Mr. RADCLIFFE asked Dr. Richardson to explain, if he would be kind enough, the steps in the zymotic process a little more in detail.

The PRESIDENT asked the Author to sketch out the line of experimental inquiry which he proposed to pursue.

Dr. MILROY thought the author's theory did not, as he had understood it, supply a sufficient reason for the spontaneous development of certain zymotic disorders, such as cholera or typhus.

Dr. CAMPS suggested that the diseases which the author had excited in the inferior animals, were not *the* diseases, but analogous affections.

Mr. SPENCER WELLS noticed, at the request of the President, the particulars of two cases of tetanus, occurring in his own practice after ovariectomy, in which he had used *woorara*.

The AUTHOR having replied,

Dr. WALLER LEWIS moved, and Dr. MILROY seconded, a vote of thanks to him for his paper, and the PRESIDENT in putting the resolution to the vote, stated that he hoped Dr. Richardson would favour the Society with further records of his researches in this important field, and that should he at any time require such assistance, a committee should be formed to observe the results of his experiments.

THE PATHOLOGICAL SOCIETY.

TUESDAY, NOVEMBER 15.

Mr. FERGUSSON, President, in the Chair.

A Report, by Drs. BRISTOWE and HARLEY, was read ON A SPECIMEN OF INTESTINAL CONCRETIONS DESCRIBED AS FIBRINOUS IN ITS NATURE.

The two masses are nearly of the same size, one measuring 3, the other 3½ inches in the long diameter, and both about two inches in thickness. The peculiar flattened rounded appearance they now present is no doubt due to their having been packed in a gallipot. On section one of them presents a dense, fibrous-looking structure. The other is also fibrous-looking, but much less dense, and more irregular in shape. We can find nothing in their ultimate character, either microscopically or chemically, incompatible with the supposition of their being either coagulated fibrin or effused lymph, and there is little in their general character, beyond their shape and bulk, in opposition to this view. We find no evidence of their being any form of polypus or other morbid growth, and are therefore disposed to accept Mr. Quekett's opinion, namely, that "they seem to be composed of lymph." At the same time we beg to add that

we are at a loss to account for their presence in the digestive canal.

Dr. HARE exhibited specimens of Cardiac Malformation, namely—

CONTRACTION OF THE PULMONARY ORIFICE, WITH AN OPENING IN THE SEPTUM VENTRICULORUM.

T. P., a male child, puny, and with some lividity of the surface, which had been noticed since birth, was first seen for bronchitis, and it was found, in addition, that the apex of the heart beat vertically below the left nipple; that the impulse was rather too strong; and that there was a single murmur synchronous with the first-sound, loudest at apex, but nearly as loud in the left infra-scapular region. The child died, at the age of two months. The weight of the heart was very nearly one ounce. The right auricle was double the size of the left; the foramen ovale was closed. Both ventricles were small, even for the size of the heart; the walls of each were considerably hypertrophied, those of the right side being perhaps thicker. The septum was thick, except near the base, where there was an opening ($\frac{3}{8}$ th of an inch in longest diameter). The aorta was of very large size, and communicating with both ventricles. The orifice of the pulmonary artery would only just admit the point of an ordinary blowpipe.

OBSTRUCTION AT THE AORTIC ORIFICE (ONLY TWO VALVES)—OPEN DUCTUS ARTERIOSUS.

C. S., male, was under observation for the last three months of his life, and died, aged 5 $\frac{1}{2}$ months. The child suffered from shortness of breath, cough, and had convulsive twitchings and once a severe convulsive attack, in which he became very blue; but usually the complexion, though dusky, was not livid. The sternum was somewhat convex, and the costal cartilages prominent, so as to give the chest a globose appearance. The impulse was too strong, and too much to the left. A loud rough murmur was heard over almost the whole of the chest, but most at the apex, systolic. The murmur was very peculiar; though single, it was, in the middle third of its duration, much more acute than at the commencement or end. Heart.—Weight, 2 $\frac{1}{2}$ ozs. Left auricle rather larger than the right one; foramen ovale closed; aortic orifice somewhat irregular in shape, and smaller than natural; valves somewhat thickened and only two in number, the larger one having a rudimentary septum. Pulmonary artery, 1 $\frac{1}{2}$ inch in circumference; valves healthy. Left ventricle very thick, even at the apex; right ventricle too thick; size considerable. Ductus arteriosus open.

These two specimens well illustrate cardiac malformation commencing at each of the two arterial orifices. In the first example the starting-point was the obstruction at the pulmonary orifice; hence very little blood got from the right ventricle directly to the lungs, but the major part passed through the perforation at the base of the septum into the aorta, and so partly into the general circulation, but doubtless partly through an open ductus arteriosus into the lungs for aërication. In the second specimen, the first point of mischief was at the aortic opening, through which the blood could not pass freely; a portion of the blood, therefore, which usually passes from the right ventricle through the lungs, did not, in this case, take that route, but went directly from the right side of the heart into the systemic circulation, by means of the open ductus arteriosus. This vessel, therefore, in the two cases, transmitted blood in opposite directions; in the former case the ductus carried the mixed blood sent by the two ventricles into the aorta, to the lungs, and in a direction the reverse of what obtains in fetal life; in the latter example it carried a portion of the blood from the pulmonary artery to the aorta, in the same direction as in the foetus. The malformation illustrated by the second specimen is a rare one.

Mr. SHILLITOE exhibited

A SPECIMEN OF NEUROMA.

He had removed it from the musculo-spiral nerve of the left arm of a lady, aged 30 years. It appeared to have been caused by a blow ten years ago. When first noticed it was about the size of a small nut; iodine paint was freely applied, and for some years it did not increase, but during the last two years it had done so rapidly. At the commencement there was no pain, though it was always tender to the touch;

recently there has been a good deal of throbbing pain, and it has caused weakness of the arm. At the time of its removal it was about the size of a billiard-ball, and on section it was found to enclose a large cyst, filled with a sero-sanguineous fluid, and clots of blood. The tumour was surrounded by a thin fibrous envelope, continuous with the sheath of the nerve; it appeared to have grown from the upper and outer aspect of the nerve. The trunk of the nerve divided into two parts, which passed on different sides of the mass, and again united on leaving it. The one part is easily separated from the tumour, but the other dips deeply into its substance, and a good deal of it seems to be lost in it. On the microscopical examination the tumour was found to consist chiefly of fibro-cellular tissue, with abundance of small rounded nuclei, and a few oval and oat-shaped ones.

Mr. FERGUSON related a case in which he had removed a neuroma connected with the external popliteal nerve. The tumour afterwards proved to have been unconnected with this nerve, the latter being merely spread over it. In a subsequent case of neuroma of one of the nerves of the brachial plexus he succeeded in removing the tumour without the nerve.

Mr. NUNN exhibited a small

TUMOUR OF THE DURA MATER.

It had been taken from a man who had symptoms of constitutional syphilis for twenty years: He died at the age of 50 from abscess of the brain connected with necrosis of the great wing of the sphenoid. He had had irregular cerebral symptoms for ten years. At the autopsy the dura mater was found to be adherent to the bone, as was also the scalp over the position of the tumour. It was connected with the dura mater in the right side of the falx. It consisted chiefly of fibro-plastic matter. In reply to Mr. Fergusson Mr. Nunn stated that there had been no symptoms of pressure.

Dr. WILKS related a case in which a man apparently moribund from cerebral disease, recovered rapidly under the administration of large doses (gr. viij.) of the iodide of potassium. He was hemiplegic, had repeated fits, and, when seen, was quite insensible. He continued apparently moribund for several days. Syphilis was suspected; but the only evidence attainable was from his wife, and to the effect that she had repeated miscarriages. After commencing the iodide the fits, paralysis, etc. disappeared, and in a short time recovery was complete. Dr. Wilks imagined that no tumour from the dura mater, unless very large, could have given rise to these symptoms by mere pressure on the surface of the brain.

Mr. NUNN stated that he had had his patient under observation for many years, and found that the cerebral symptoms were always controlled by large doses (gr. xv.) of the iodide, until the last two years. At this time the patient was subjected to a course of mercury. Mr. Nunn believed that this occasioned the necrosis, and that this, then, gave rise to cerebral symptoms, which were not under the same control as those before, which, he believed, arose from the tumour only.

Dr. MARKHAM related a case in which recovery from epileptic fits followed in a patient who was treated by iodide of potassium, under the impression that they arose from the presence of lead in the system.

Dr. GRAILY HEWITT exhibited for Mr. CHOLMLEY

A MASS EXPELLED FROM THE UTERUS.

The patient was a lady, aged 55. She had been a widow ten years. She was said to have menstruated regularly up to the time of the expulsion of the mass; but probably the discharges were not truly menstrual, but semi-periodical hæmorrhages excited by the presence of the tumour. The expulsion was accompanied by very great hæmorrhage. The specimen was smooth on the surface except at one small spot, by which, probably, it had been attached. On its surface were several cysts containing fat. The rest was of a fibrous texture like that of fibrous tumour of the uterus.

Mr. FLOWER now brought forward

A SPECIMEN OF SANGUINEOUS CYST.

It had been removed by Mr. de Morgan. Eight years ago it was merely a small tumour under the skin over the supra spinous fossa. It gradually increased and had attained the size of a large orange. The specimen shown consisted of skin,

cyst-wall, and internally of a layer consisting of minute crystals of cholesterine. It also contained a dark reddish fluid.

Mr. FERGUSSON remarked that he had observed that cholesterine occurred in cysts containing grumous-looking fluid, and also that such substances seemed very slow in undergoing decomposition.

Dr. HARE now brought forward

A SPECIMEN OF CANCER OF THE LIVER.

It was taken from a patient of Mr. Kirby; the age of the patient was fifty. All the symptoms referable to this disease had arisen within eight weeks preceding her death. A mass was found by examination in the right hypogastric region, which gradually extended as low as the anterior superior spinous process of the ilium. Edema of the lower extremities followed, and next jaundice and death. The liver weighed nine pounds.

Mr. FERGUSSON exhibited a

CHALKY TUMOUR.

It was taken from the arm of a girl, aged 12. It had been noticed only four months; during the third month it grew rapidly. It was situated immediately below the skin on the outer side of the arm, two or three inches above the elbow. There was no history of gout.

Dr. COOTE exhibited a

NEEDLE FOUND IN THE OMENTUM OF A WOMAN, who had died of some other affection. No history of the case was attainable. The needle, larger than a common sewing-needle, was blackened. The only mode of accounting for it was that it might have been swallowed, and then have passed through the walls of the stomach into the omentum. There was a corresponding stellate cicatrix at the lower part of the stomach, through which Dr. Coote believed it might have passed.

Dr. WILKS related a case of

TUBERCULAR DISEASE OF THE BLADDER AND URETHRA.

A man, about 30 years of age, and who had been ailing for some considerable time, first presented himself as a patient at Guy's Hospital with perineal abscess. This was opened, leaving a fistula. He subsequently became a Medical patient and died of phthisis. Besides disorganisation of the lungs and tuberculous disease elsewhere, one kidney was found quite destroyed by the same affection, and this continued down the ureter to the bladder. The latter externally had the vesicular seminales enlarged by tuberculous deposit, and internally the mucous membrane was covered with tubercles, which on the trigone formed one ulcerated patch; the same continued over the surface of the prostate and down the urethra as far as the middle of the spongy portion. In the membranous canal an ulceration had occurred, giving rise to the perineal abscess. Dr. Wilks believed that this tuberculous affection of the bladder and urethra was never a primary disorder, but always, as in the present case, the result of the same disease elsewhere—generally by the continuation downwards from the kidney by the ureter. The affection was thus analogous to the tuberculous disease of the uterus, which in like manner is secondary, and forms only a part of a more general tuberculosis of the abdomen, the disease in this case being propagated from the Fallopian tubes to the cavity of the uterus. The affection in the male, which would be strictly analogous, is the case which Dr. Wilks had witnessed, where a tuberculous disease of the testis had become propagated along the vas-deferens to the inner surface of the prostate; and thus the tuberculous affections of prostate and uterus may take their place together as the other diseases of these organs. Although it appeared that tuberculous affections of the bladder are not primary conditions, yet it was of some practical interest that this man first put himself under the Surgeon's care for perineal abscess, and Dr. Wilks mentioned another similar case where an extravasation of urine occurred from tubercular ulceration of the urethra.

Mr. FERGUSSON related a case in which he had performed lithotomy, and removed an oxalate of lime calculus, weighing four ounces. At the operation he felt several small masses, projecting into the bladder. The patient did well, and for

two years remained so. He was, after that time, one day attacked suddenly with pain in the region of the bladder. He died. At the autopsy medullary disease of the bladder was found to exist.

Mr. HENRY THOMPSON did not think the disease was often local. In all the London Museums he had only found nine or ten cases; and in all these there was co-existent tubercular disease elsewhere. He asked Dr. Wilks if the tubercle was in the substance of the prostate, or merely below the mucous membrane.

Dr. WILKS replied that it was merely below the mucous membrane.

Dr. GIBB exhibited for Mr. J. HENRY THOMAS specimens of CORAL-SHAPED AND OTHER CALCULI FROM BOTH KIDNEYS—PUS IN ONE, AND BLOOD IN THE OTHER.

The patient, aged 27, died October 1, with symptoms of renal calculus—was operated upon for stone twelve years ago, and two months ago Mr. Thomas removed three small phosphatic calculi from the membranous portion of the urethra. The urine had for years before death been mixed with pus, and for some months blood was present, latterly in large quantities. The right kidney was a mere shell, filled with gravel, stones, and bloody urine; one stone weighed 62 grains, and was dark in colour. The left kidney was enlarged and sacculated, the sacculi containing pus; the pelvis was filled with an arboriform calculus of a whitish colour, not unlike a branch of coral, weighing $2\frac{1}{2}$ drachms. There were many smaller calculi of different shapes, and several fragments were broken off the large specimen in taking it out. The ureters were dilated, and the bladder congested, but neither contained any stones.

Dr. GIBB remarked that the chief points of interest in the case were, the presence of blood in one kidney, with calculi composed of phosphate of lime coloured black by animal matter; and in the other kidney pus, with calculi composed of triple phosphates, many of them being studded with most beautiful crystals, especially visible on the extremities of the coral-shaped specimen.

Dr. GIBB also exhibited, for Mr. J. T. PAUL, a

VIRGIN UTERUS (FROM A FEMALE AGED 50 YEARS) WITH A BONY TUMOUR ATTACHED TO ITS FUNDUS.

The patient was found dead in her bed on the morning of the 13th November. The heart was large and flabby, the walls hypertrophied, and its cavities filled with semi-coagulated blood. The lungs were much congested and emphysematous; the bronchial tubes being filled with frothy mucus. The liver, spleen, kidneys, brain, and stomach were considerably congested. The uterus was very small, not larger than that from a child twelve years old, and had a bony tumour attached to the superior part of its fundus, the size of a Barcelona nut. The interior of the organ was full of glairy mucus, exuded from the os. The left ovary was atrophied to the size of a bean, while the right was normal, and contained a fibrous tumour the size of a pea embedded in its substance. The hymen was perfect. She never had any children. Death was attributed to the condition of the heart; but she was known to be a great sufferer from asthma during life, and this must have had a good deal to do in bringing about the fatal result, especially during this foggy weather. Dr. Gibb considered that the body of the uterus had undergone absorption, and thus accounted for its small size; and he looked upon the small bony growth as a degenerated fibrous tumour, whose pedicle had now become membranous.

Mr. NATHANIEL WARD exhibited a specimen of

MEDULLARY SARCOMA OF THE RIGHT FEMUR.

The patient, a young lady, aged 20, had been under the care of Mr. Daldy and himself. Pain in the region of the inner condyle of the femur to the extent of the area of a shilling, and slight effusion into the synovial sac of the joint, were the first indications of the disease. The pain was not referrible to the receipt of injury, and was regarded by her friends in attendance on her as of a rheumatic character. These symptoms yielded at first to treatment, but soon afterwards the knee-joint and lower part of the thigh became

involved in a large tumour which extended with great rapidity, the cutaneous veins becoming dilated, the integument tense and shining, and fluctuation being here and there to be detected. Ultimately the tumour measured round the most prominent part of its circumference thirty-two inches, and it had extended half way up the thigh. Between five and six months after the first symptoms had appeared the patient died from exhaustion, slight attacks of hæmorrhage from the popliteal aspect of the tumour having preceded death. The thigh-bone had also given way about the lower fourth. On the post-mortem examination, a vertical section was made of the tumour. It appeared to have arisen from the cancellated tissue of the inner condyle. A large quantity of blood escaped from numerous cysts formed at different parts of the growth, particularly towards the circumference. The walls were lined with ragged fibrin. The solid part of the tumour was made up of medullary cancer, fibrin, and masses of bone, apparently the broken-down femur, the lower quarter of the shaft of which had disappeared. The periosteum could be traced prolonged from the shaft above this over the tumour; and in the interior of the former were medullary mixed up with myeloid deposits. Both lungs were permeated by masses of medullary cancer. None of the abdominal organs nor lumbar and inguinal glands were affected.

Dr. HARLEY exhibited an

OAT-HAIR INTESTINAL CONCRETION.

This calculus is from the collection of the late Mr. Liston, in University College Museum. It is of a circular form, and measures one inch in diameter. Although to the eye it looks like a piece of brown sandstone, it is extremely light, being of a less specific gravity than water. On section the internal surface presents a pale coffee colour, and looks and feels not at all unlike a piece of brown felt. Examined with the microscope, it is seen to consist of a number of tubular hairs and vegetable spiral vessels. These hairs, as first pointed out by Dr. Wollaston, come from the seed of the oat. The calculus has an external coat of about a line in thickness of a different-looking substance. This is composed of a mixture of hairs, mucus, and inorganic matters. On incinerating this part, the ash was found to consist of ammonia, lime, magnesia, and a little soda, combined with phosphoric and sulphuric acids. The calculus is said to be one of twenty passed at different times by the patient.

OBITUARY.

DR. CARNEGIE, OF WIMBORNE.

DIED November 16, at Wimborne Minster, Dorsetshire, John Carnegie, M.D., Extra Licentiate of the Royal College of Physicians of London. He was the son of Mr. John Carnegie, of Kingslaw, East Lothian, N.B., and was born at Leith in 1779. He received his early education at the High School, Edinburgh, of which Dr. Alexander Adam, the author of the "Roman Antiquities," and many other well-known works, was at that time Rector, and where he had for his contemporaries Lord Brougham, the late Lord Murray, and other distinguished men. Having chosen the Medical Profession, he was apprenticed to John Bell. He attended for several years the Literary and Medical Classes of the University of Edinburgh. In 1799 he became a Member of the College of Surgeons of Edinburgh, and in 1804, having passed an examination before the London College of Surgeons, he was appointed Assistant-Surgeon in the 57th Regiment of Foot. For many years he was stationed in the Island of Jersey, where, acting on the Medical Staff, he had the charge of an extensive Military Hospital. Here his unceasing devotion to the arduous duties of a large garrison attracted the notice of the late General Gordon and the late Sir George Don, the successive Governors of that Island, and through the recommendation of the latter, he was appointed, in the year 1811, to the Surgeoncy of the 62nd Regiment. He accompanied this Regiment to the Peninsula, but his health failing he was soon obliged to return home invalided, and in the year 1814 was placed on half-pay. During this year he took the Degree of M.D. at Edinburgh. In 1817 he became a member of the College of Physicians of London, and after practising for some time at Wells, in Somersetshire,

in 1820 he commenced practice as a Physician at Wimborne, where he continued to reside until his death.

Dr. Carnegie was a man of the widest general information, and in strictly Professional knowledge was in advance of his time. His Thesis on Typhus is valuable as giving an account of fevers which actually prevailed in the 57th and 62nd Regiments in Jersey, during the first fourteen years of this century. Although more stress is laid upon the use of antimonials than would be the case now, yet there is not a word about blood-letting; and it is evident that sponging with cold vinegar and water was the chief remedy relied on to subdue delirium and excitement, while the use of wine or brandy, in small doses every second or third hour, is prescribed in the very terms which would be used at the present day. He particularly suggests the use of wine or brandy with blisters for the pulmonary congestion of fever.

It is seldom that a Physician enjoys a large practice in the country, and Dr. Carnegie found no exception to this rule; but he delighted in rendering his services unpaid to all who were in need of them, and among those who profited largely by his skill and kindness were some of the neighbouring Medical men and their families. The presence of a man of great information, and knowledge of the world, and of liberal ideas, is no small boon to any provincial circle; and the removal of such a man, whose chief employment was the exercise of Professional and general benevolence, will long be lamented.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS.—At the Comitia Majora held on Wednesday, November 2nd, Abraham Duke, M.D., Rugby, was admitted a Member of the College, under the temporary Bye-Laws.

The following gentlemen were also admitted Members of the College under the temporary Bye-Laws, at the Comitia held on the 21st inst. :—

Adey, Charles Augustus, M.D., St. Leonards-on-Sea
Allan, James Brands, M.D., Hyde-park-place, W.
Anstie, Francis Edmund, M.D., Onslow-square
Arnott, George, M.D., Cheltenham
Balfour, Thomas Graham, M.D., Sumner-place
Birkett, George, M.D., Stoke Newington
Brown, Robert Gosset, Hempstead
Bryan, James Bedingfield, M.D., Kensington-park-gardens
Bryson, Alexander, M.D., Barnes
Burder, George Forster, M.D., Clifton
Burgess, Thomas Henry, M.D., Portsmouth
Camps, William, M.D., Park-street
Castaneda, Michael, M.B., Albany-street
Chevallier, Barrington, M.D., Ipswich
Christie, Thomas Beath, M.D., Hackney
Collum, Robert, M.D., Chester-place, Hyde-park
Cooper, Sir Henry, M.D., Hull
Copeman, Edward, M.D., Norwich
Croft, John M'Grigor Augustus T., M.D., Abbey-rd., St. John's-wood
Davies, William, M.D., Bath
Davies, Thomas, M.D., Chester
Davis, John, M.D., Bristol
Dudley, John Gardner, L.M. Cantab., Rainhill, Prescot
Duffin, Alfred Baynard, M.D., Langham-place
Durrant, Christopher Mercer, M.D., Ipswich
Dymock, Archibald, M.D., Louth, Lincolnshire
Fox, Edward Long, M.B., Bristol
Henderson William, M.D., Clifton
Hicks, John Braxton, M.D., Wellington-street, London-bridge
Higgins, Charles Hayes, M.D., Birkenhead
Humble, Thomas, M.D., Newcastle-upon-Tyne
Irwin, William Crossley, M.D., Leicester
Jephson, John Holmes, M.D., Conduit-street West
Jones, Walter David, M.D. Edin., Lancych, Newcastle Emlyn
Johnson, James, M.D., Green Ayre, Launcester
Kebbell, William, M.D., Brighton
Kennion, George, M.D., Harrowgate
Kenny, Mason Stanhope, M.D., Halifax
Kitching, George, M.D., Enfield
Leonard, Peter, M.D., Royal Hospital, Haslar
Lewis, Thomas, M.B., University-street
Loney, William, H.M.S. "Dauntless"
Madden, Lewis Powell, M.D., Jacobstowe, Devonshire
Maxwell, William Brook Charles, M.D., Winchelsea
Morehead, Charles, M.D., Bombay
Noott, William Francis, Alverstoke
Paine, William Henry, M.D., Stroud, Gloucestershire
Parker, Thomas Preston, M.D., Bishopwearmouth
Paul, John Hayball, M.D., Camberwell-road
Pickstock, George Newport, M.D., Paignton, Devon
Phillips, Henry John, M.D., Kensington-gate
Ranking, William Harcourt, L.M. Cantab., Norwich
Ransom, William H., M.D., Nottingham
Risk, Keats Robinson, M.D., Blackpool
Robertson, William Henry, M.D., Buxton

Robertson, John, Sudbury
 Roe, William Hamilton, M.B., Park-street
 Rogers, William Richard, M.D., Berners-street
 Ross, Andrew, M.D., Waterloo, Hants
 Scott, William, M.D., Huddersfield
 Spencer, John, M.D., Regent's-park-terrace
 Stanton, John, M.D., Upper George-street
 Stevens, Henry, M.D., St. Luke's Hospital
 Tunstall, James, M.D., Bath
 Wane, Daniel, M.D., Grafton-street
 Whytehead, Henry Yates, M.D., Crayke, Yorkshire
 Willett, Edmund Sparshall, M.D., Isleworth
 Wollaston, Robert, Cheltenham

The following gentlemen were elected Fellows of the College on November 21 :—

Maclachlan, Dr. Daniel
 Shapter, Dr. Thomas
 Smith, Dr. William Tyler

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 17th November :—

Bankart, James, Leicester
 Mawley, Augustus, Birmingham
 McCann, John, Tynyn, Co. Longford, Ireland
 Taylor, John, Emsworth, Hants
 White, Edward, Birmingham

The following gentlemen also on the same day passed their First Examination :—

Braddon, Charles Hitchman, Upton-on-Severn, Worcestershire
 Haynes, Allen Lankester, Evesham, Worcestershire
 Lovegrove, James Francis, Maidenhead

UNIVERSITY OF LONDON.—*Second M.B. Examination, 1859.*—The following is a list of Candidates who obtained the Degree of Bachelor of Medicine at the recent Examination :—

Adams, Samuel Hoppus, University College
 Crowfoot, William Miller, St. Bartholomew's Hospital
 Davis, Theodore, St. Bartholomew's Hospital
 Gasquet, Joseph Raymond, University College
 Hill, Matthew Berkeley, University College
 Jones, Philip Sydney, University College
 Liddon, William, King's College
 Marriott, Charles Hayes, University College
 Moxon, Walter, Guy's Hospital
 Robbs, William Edward, King's College
 Sansom, Arthur Ernest, King's College
 Simpson, Henry, University College
 Thompson, Edmund Symes, King's College

ROYAL COLLEGES OF PHYSICIANS AND SURGEONS, EDINBURGH.—The following gentlemen, having completed the Course of Study, and undergone the Examinations prescribed for obtaining the Double Qualification in Medicine and in Surgery, were on the 18th instant admitted as Licentiates of both Colleges, viz. :—

Maclagan, David Philip, Edinburgh
 Moore, Michael James, Belfast
 Reid, Patrick Richard, County of Kildare, Ireland
 Shaw, John Cardy, Ceylon
 Thom, Alexander, Edinburgh

KING AND QUEEN'S COLLEGE OF PHYSICIANS, IRELAND.—At a meeting of the King and Queen's College of Physicians, Ireland, held on the 16th inst.

Michael Fenton Manifold, M.R.C.S.

having been duly examined, was admitted a Licentiate of the College.

DEATHS.

BAYLEY.—November 7th, at New York, Guy Carleton Bayley, M.D., aged 73.
 CHURCHILL.—October 27th, at New York, of pneumonia, Charles W. Churchill, M.D., aged 45.
 DALY.—Recently, on board the *Merlin*, on the passage from Melbourne to Calcutta, Dr. Daly, son of Mr. John Daly, of Tuam.
 FINUCANE.—November 14, Henry Patrick Finucane, of Bradford, Yorkshire, L.S.A. Lond. 1833, aged 62.
 HATFIELD.—November 17, John Rayner Hatfield, of Wibsey, near Bradford, Yorkshire, L.S.A. Lond. 1841, aged 43.
 LEONARD.—November 16, at his residence, Brunswick-square, Bristol, Isaac Leonard, M.R.C.S. Eng. 1818; L.S.A. Lond. 1838; aged 63.
 REIDY.—November 16, William Hely Reidy, of the Caledonian-road, Islington, M.R.C.S. Eng. 1835, aged 45.

INFANT MORTALITY.—In the East Wymer sub-district "the large number of deaths (eighteen) from atrophy seems, on inquiry, to depend on improper food, from the mothers not suckling their children, as they say it would interfere too much with their work."—*Registrar-General's Quarterly Report.*

THE Correctional Tribunal of the Seine has lately fined a Pharmacien 1000 francs for keeping a consultation-room by the side of his shop. The Pharmacien also kept a Doctor, at 50 francs per month, to do the business; but this did not avail him, as he was himself present, and wrote the prescriptions, which were afterwards made up by his *élève*.

WOORARA IN TETANUS.—A very interesting discussion took place last Tuesday evening at the Medico-Chirurgical Society, *à propos* of three cases related by Mr. Spencer Wells, in which he had used woorara poison as a remedy in tetanus. Our readers will find the report of the discussion next week. The remarks of Dr. Harley were full of interest. It was pointed out by Mr. Wells that here, as in some other cases, the lively French had borrowed from the phlegmatic English without any acknowledgment of the thing borrowed.

LONDON GUANO.—Mr. Shepherd, C.E., says: "If we take the whole of the London sewage as it flows into the Thames at 70,000,000 tons annually, and apply it at the rate of 40 tons per acre, it would manure 1,750,000 acres, or 2734 square miles, of land annually, without the aid of a single cartload of farmyard manure; and wherever the sewage has been employed it has increased the fertility of the land 100 per cent. And it is also a fact that 750 tons of the rich sewage of London can be delivered to a distance of 100 miles round London, and on every farm included in that area, at a less cost than the farmer is now paying for one ton of guano, while the 750 tons of sewage contain more fertilising matter than five tons of guano."

UNIVERSITY OF ST. ANDREWS.—The following gentlemen have been elected as Examiners for Medical Degrees for the year 1860, in addition to Dr. Day, the Chandos Professor of Anatomy and Medicine, and Mr. Connell, the Gray Professor of Chemistry (who is assisted by Dr. Heddle). *In Medicine* :—Dr. W. T. Gairdner, Lecturer on the Practice of Medicine, and on Clinical Medicine, Edinburgh; Dr. Alexander Wood, President of the Royal College of Physicians, Edinburgh. *In Surgery* :—Dr. George Buchanan, Surgeon to the Royal Infirmary, Glasgow; Dr. John Struthers, Assistant-Surgeon to the Royal Infirmary, Edinburgh, and Lecturer on Operative Surgery. *In Midwifery and Diseases of Women and Children* :—Dr. A. Anderson, Professor of Medicine to the Andersonian University, Glasgow; Dr. J. Matthews Duncan, Lecturer on Midwifery, Edinburgh.

SULPHURIC ETHER SUBSTITUTED FOR CHLOROFORM AT LYONS.—At Lyons, the second city in France, sulphuric ether has almost universally superseded chloroform both in Hospital and private practice; and as the result of a recent discussion at the Medical Society of that town, the following resolutions were passed unanimously :—"1. Sulphuric ether employed as an anæsthetic is less dangerous than chloroform, no accident, indeed, having followed its exclusive and abundant employment at Lyons during eight years. 2. Anæsthesia may be as constantly and as completely induced by it as by chloroform. 3. If ether gives rise to inconveniences which are not produced to the same extent by chloroform, these are of little consequence as compared with the dangers inherent to the use of the latter. 4. Ether should, therefore, be preferred to chloroform." It was proposed that the fact of using chloroform should be stigmatised as imprudent; but the Society declined taking this step, contenting itself with declaring that ether fulfils the same indications as chloroform without giving rise to the same dangers.

THE DENTITION-DIARRHŒA of infants, in M. Trousseau's opinion, ought not to be either respected or encouraged as some Practitioners consider it should be. It is, he thinks, always well to combat an evil which may have such bad consequences. The *cholera infantilis* is what he most dreads. These are his remedies—He gives, mixed with milk or with gum syrup, 40 to 60 grammes of lime-water; or, mixed with sugar, in milk, or any other albuminous or proper liquid, one of the following salts :—Carbonate of lime, pure, 1 gramme; bicarbonate of soda, 50 centigr.; carbonate of magnes., 25 centigr.; or the white decoction of Sydenham may be given. If the diarrhœa still continues 3 or 4 grammes of sub-nitrate of

bismuth are to be given, and every third day a neutral salt, as the tartrate of potass and soda, in the dose of 4 to 6 grammes dissolved in water or milk. If there are vomitings, then hydragryum c. cretâ should be used. If all these methods fail, then injections must be employed; 8 to 10 centigr. of sulphate of copper in 60 grammes of water; or the following potion may be taken in spoonful during the 24 hours:—Nitrate of silver, 2 centigr.; distilled water, 30 grammes; simple syrup, 20 grammes. Another good remedy is that which is so successfully employed at the Foundling of Moscow. It consists in giving to the little patient raw meat, very finely chopped up, and beaten in a mortar, and then passed through a fine sieve. It is then mixed with sugar, or preserves, or conserve of roses. The best meat is the fillet of beef, or the centre part of a mutton chop. The dose is 10 grammes the first day, 20 the second, and 30 the third. At the same time albuminous water is given. It is well to know that for the first few days the stools will be reddish and of a bad odour.

THE NEW CHAIR OF PHARMACOLOGY AT THE PARIS FACULTY OF MEDICINE.—The chair of Pharmacy at the Faculty of Medicine has just been converted into one of Pharmacology, and M. Regnault has been nominated the first professor. "The course of pharmacology," M. Dumas says in his report to the Minister of Public Instruction, "will comprehend:—1. An exposition of the general procedures for the preparation of Medicines. 2. The special examination of medicinal agents in relation to their natural history, their chemical and physical characters, their pharmaceutical forms, and their adulterations. 3. The art of constructing formulæ. 4. The history of natural and artificial mineral waters; and 5. The ancient and modern history of pharmacy." The following are the motives which have induced the commission to unite the *materia medica* itself to pharmacy, and to separate it from therapeutics. The *materia medica*, or the natural history of drugs, is a branch of the teaching the art of healing; the basis or point of departure of which is rather to be sought amidst the collections of the naturalist, and in the shop of the pharmacien than at the bedside. On the contrary, it is at the bedside that therapeutics must be studied; and when the Faculty has to choose a professor of therapeutics, it has, ministering to the wants of its pupils, to occupy itself with the doses in which medicines should be prescribed, the preferable forms for their administration, and the effects to be expected from their action, regard being had to the condition and strength of the patient, the complications of the disease, and the general conditions of time and place. Therefore, it selects a clinical observer, who by habit and taste is in general a stranger to the study of the *materia medica*, which in his hands is confined to the history of the usual remedies. But for the chair of pharmacology a candidate must be chosen who is specially prepared, by his practical knowledge of simple drugs, and by his studies in the two-fold direction of chemistry and natural history, to undertake a good and complete course of *materia medica*."

OPENING OF THE PARIS FACULTÉ DE MÉDECINE.—The session 1859-60, of the Paris Faculty, was opened with the usual *éclat* on the 15th inst., when M. Wurtz delivered an effective *éloge* on Souberain, who died scarcely two years after he had been chosen into the Faculty. The following passage on the interest attaching to scientific discovery, abstractedly considered in respect to actual application or possible ulterior utility—as illustrated by the history of chloroform,—was vehemently applauded: "During long years chloroform, now employed in hundreds of kilogrammes, figured as a mere object of curiosity, possessing a purely scientific interest. But be not deceived; for it is the curiosity of the philosopher which prepares the road for the inventor, and theory must precede application. Where would be the marvels and the glory of our century, if the human mind were, as in the middle ages, abandoned to the chances of a gross empiricism and to the guardianship of unintelligible traditions? In our time, it is Science which arouses, directs, and fertilises the genius of Invention; and the search for the True, will conduct sooner or later to the discovery of the Useful. Yes, I dare affirm that nothing is useless in science. Too often we hear the question asked, 'What possible good is there in this multiplicity of theoretical facts which she is accumulating?' It is only Ignorance that can hold such language. 'That which we are ignorant

of,' says Fontenelle, 'we willingly treat as useless.' Let us then, go on collecting truths, giving our time and attention to objects apparently sterile. The hidden utility will be one day discovered; and then is not every intellectual triumph worthy of our respect? If we are to judge of the beauty of a work by its venal value, the grandeur of a conception by its immediate application, the nobility of a career by its material profits, tell me in what rank are we to place Dante, Corneille, Leibnitz, and Newton; and what will become of those noblest gifts of the mind, philosophic penetration, eloquence, and poetry." The Faculty has not adjudged the *Corvisart Prize*, for want of essays of sufficient merit. The subject for the prize of 1860 is thus stated,—"Determine by observations made in the Clinic of the Faculty, the effects of cinchona in both internal and external septic affections."

THE UGLIEST AND MOST OBSCURE OF SEA-WORMS.—Whether we are intruding or not in turning this stone, we must pay a fine for having done so, for there lies an animal as foul and monstrous to the eye as "hydra, gorgon, or chimera dire," and yet so wondrously fitted to its work that we must needs endure, for our own instruction, to handle and to look at it. Its name, if you wish for it, is Nemertes, probably N. Borlasii, a worm of very "low" organisation, though well fitted enough for its own work. You see it? That black, shiny, knotted lump among the gravel, small enough to be taken up in a dessert-spoon. Look now, as it is raised and its coils drawn out. Three feet—six—nine at least, with a capability of seemingly endless expansion; a shiny tape of living caoutchouc, some eighth of an inch in diameter, a dark chocolate-black, with paler longitudinal lines. Is it alive? It hangs, helpless and motionless, a mere velvet string across the hand. Ask the neighbouring Annelids and the fry of the rock fishes, or put it into a vase at home and see. It lies motionless, trailing itself among the gravel; you cannot tell where it begins or ends; it may be a dead strip of sea-weed, *Himanthalia lorea*, perhaps, or *Chorda filum*; or even a tarred string. So thinks the little fish who plays over and over it till he touches at last what is too surely a head. In an instant a bell-shaped sucker mouth has fastened to his side. In another instant, from one lip, a concave double proboscis, just like a tapir's—another instance of the repetition of forms—has clasped him like a finger; and now begins the struggle, but in vain. He is being "played" with such a fishing-line as the skill of a Wilson or a Stoddart never could invent; a living line, with elasticity beyond that of the most delicate fly-rod, which follows every lunge, shortening and lengthening, slipping and twining round every piece of gravel and stem of sea-weed with a tiring drag, such as no Highland wrist or step could ever bring to bear on salmon or on trout. The victim is tired now, and slowly, and yet dexterously, his blind assailant is feeling and shifting along his side till he reaches one end of him; and then the black lips expand, and slowly and surely the curved finger begins packing him end foremost down into the gullet, where he sinks, inch by inch, till the swelling which marks his place is lost among the coils, and he is probably macerated to a pulp long before he has reached the opposite extremity of his cave of doom. Once safe down, the black murderer slowly contracts again into a knotted heap, and lies, like a boa with a stag inside him, motionless and blest.

THE SMETHURST CASE.—The following extracts from a capital anonymous letter in the *Times* will interest many of our readers:—"Fortunately Science is so old and its shoulders so broad that it will not fall crushed by the weight of Sir G. Cornwall Lewis's censure. In the opinion of the Secretary of State, our legal method of arriving at truth is perfect, no fault is there, the right hon. gentleman cannot see 'any defect in the constitution or proceedings of our criminal tribunals.' Yet, unfortunately, in the case of Dr. Smethurst, perfect as our system is, it absolutely failed, and there arose a 'necessity' for granting a free pardon to a man condemned to die. This necessity, according to the Home Secretary has 'arisen from the imperfection of medical science, and from the fallibility of judgment, in an obscure malady, even of skilful and experienced medical practitioners.' In his judgment, the evil is due to science and scientific men, and not to the machinery of the law. In my judgment, there are faults in both. The difficulties inherent in the reception of scientific evidence can be overcome only by the increase of general education. But the practical evils of the present day may be

avoided by changes in the method of procedure adopted in our criminal trials. Let the spirit of antagonism and of rhetorical display be abandoned by our counsel; and let them be so well educated in science that they may know how to elicit truth and eliminate error. Then we shall not have the discovery of chlorate of potass, in fluid administered by a suspected man, described as a fearful disclosure, and linked on to its employment in the manufacture of lucifer matches and percussion caps. Or, if we have such pendants to the leading counsel's speech, his learned brother might tell the Court that the said deadly drug was given in ten-grain doses to infants six months old. If the barrister's scientific education was what it ought to be, there would soon be an end of the discrepancies between scientific witnesses. Let the latter be cross-examined as they could conduct this process for each other, and the jury would have little difficulty in determining where lay the truth. Let the Medical man who speaks so confidently of his power to discriminate between dysentery and poisoning be asked how many cases of either he has seen; and let him be made to point out the differences between them; and a jury would soon estimate the value of his opinion. Let not the prisoner be first painted black as night, and then bright as day; let not one learned brother try to paint the lily, and another to darken the unmentionable fiend; but let them both adhere to truth. Let the facts of science be kept distinct from the opinions of scientific men, from the recital of their original ideas, or the publication of their extensive practice; and let the judge but hold the balance, not throwing the weight of his great authority into either scale, but simply casting into the one side or the other the evidence that is worthy of such place; and then we shall cease to have hasty verdicts of Guilty followed by universal reprobation and public dissatisfaction with our tribunals. We shall have no weak slanders upon Science, nor announcements from a Secretary of State that although a method is perfect, it may perfectly fail."

SCIATICA AND THE ACTUAL CAUTERY.—M. Valleix and M. Jobert have done wonders in the cure of sciatica by the actual cautery, and now again M. Monneret, of the Hôpital Necker, comes forward as its great admirer. Of thirteen cases he makes a cure of ten. Some of these were cured after one, some after two, others after several cauterisations. The application of the cautery requires a skilled hand. It should be lightly used, so as only to brawn the surface of the skin with lines drawn upon it; it is to be done with a hatchet-shaped cautery at a white heat. This is run rapidly over the seat of pain, and according to the extent and age of the complaint is to be measured the length of the lines. M. Monneret almost always practises three or four lines extending from the hip to the outside of the popliteal space. If the leg is painful, he goes from head of fibula to external ankle. In the foot he is contented with two or three lines.

ST. VINCENT'S HOSPITAL, DUBLIN.—On Thursday, the 17th instant, the inaugural address for the winter season of 1859-60 was delivered in the theatre by Dr. O'Ferrall, chief Medical adviser to the Hospital. After some preliminary observations, Dr. O'Ferrall said that the great aim of clinical instruction was to render the students good Medical Practitioners. He said that, in his opinion, the great defect of Medical education was that, while students were thoroughly instructed in the theoretical departments of the profession taught in the school and lecture-room, sufficient time was not devoted to the practical application of these principles, or, in other words, that they failed to acquire that intimate, he might almost say personal, acquaintance with disease which is only to be gained by constant attention to Hospital practice. "It is quite possible," said Dr. O'Ferrall, "for a student to go through the usual course of Medical lectures and reading, to pass his final examination with great credit, and even to become competent to lecture on the subjects which he has learned, without at the same time becoming a good practitioner. Thus many persons, by studying the works of John Bell, Sir Joshua Reynolds, Flaxman, or Ruskin, have acquired an intimate knowledge of the history and principles of art, but who, at the same time would not be able to distinguish a Murillo, from a Rembrandt or a Caravaggio. In the same manner, to hear one of those theoretically-educated Medical men speaking of disease, you would imagine that he was a profound Physician. Take him to the Hospital, however, and he is quite at fault. He knows the theory of medicine well

enough, but he has not that personal acquaintance with disease without which it is impossible to become a good practitioner. Show him a case of interest—he looks at it for awhile, then he looks at you, and ends by asking, "What is it?" If you are charitable enough to tell him what the disease is, then he once more becomes eloquent. He immediately recounts the symptoms of the affection as described by the best authorities, and details the routine treatment recommended by them. In fact he knows everything about disease—except disease itself." Dr. O'Ferrall next enlarged upon the impossibility of successfully cultivating the Medical profession, unless real interest were felt in the pursuit. "If," said he, "after six or twelve months' attendance on the Hospital, you find that you do not prefer to linger in the wards, and to familiarise yourself with the varied phases of disease, rather than to amuse yourself with periodicals or the other luxuries of literature, the sooner you change your avocation the better. Too often," said he, "a feeling of false delicacy, or deference to the wishes of their friends, prevents young men from making a change when they have once commenced. They go on from year to year, forgetting all the time that, in a fruitless attempt to cultivate that for which Nature never intended them they are wasting abilities which, if properly directed, might have made them eminent clergymen, able lawyers, or successful men of business." Dr. O'Ferrall then proceeded to express his conviction that before any one was entrusted with the heavy moral responsibility of practising the Medical profession, he ought, in addition to the present theoretical examination in the College Hall, to be subjected to a practical test in the Hospital. "The competitive examinations for admission into the public services, the examinations for the diplomas of the different licensing bodies," said he, "are all tending rapidly to this. I feel confident that the period is not far distant when this principle will be not only recognised, but fully carried out in all these departments." Dr. O'Ferrall concluded an elaborate and most interesting address, of which the above is a brief summary, by describing in detail to the pupils the method of clinical instruction which he proposed to adopt in the Hospital during the ensuing winter session.

VITAL STATISTICS OF LONDON.

Week ending Saturday, November 19, 1859.

BIRTHS.

Births of Boys, 958; Girls, 902; Total, 1860.

Average of 10 corresponding weeks, 1849-58, 1525.5.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	636	607	1233
Average of the ten years 1849-58	569.8	543.7	1113.5
Average corrected to increased population	1225
Deaths of people above 90	8
Deaths in 15 General Hospitals	43	29	72

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Population, 1851.	Small pox.	Measles.	Scarlatina.	Diphtheria.	Whooping-Cough.	Diarrrhoea.	Typhus.
West	376,427	2	12	7	..	5	5	5
North	490,396	7	2	25	2	4	1	3
Central	393,256	5	8	24	3	5
East	455,522	4	11	18	1	6	4	13

BOOKS RECEIVED.

- Lectures on the Diseases of Infancy and Childhood. By C. West, M.D. Fourth Edition. London: 1859.
- The Nature and Treatment of Gout and Rheumatic Gout. By A. B. Garrod, M.D., F.R.S. London: 1859.
- The Pathology and Treatment of Pulmonary Consumption. By J. H. Bennett, M.D. Second Edition. Edinburgh: 1859.
- The South of France. By Edwin Lee, M.D. London: 1859.
- Fresenius' Qualitative Chemical Analysis. By J. Lloyd Bullock. Fifth Edition. London: 1859.
- Phases of Physic. By John Cockle, M.D. London: 1859.

Curative Treatment of Paralysis and Neuralgia. By H. W. Lobb. Second Edition. London: 1859.

The Ulster Revival. By S. Gwynn, A.B. Coleraine: 1859.

Remarks on the Treatment of Consumption. By C. J. Thompson, M.D. London: 1859.

Mayne's Expository Lexicon. Part IX. London: 1859.

Ure's Dictionary of Arts, etc. Part I. New Edition. Edited by R. Hunt, F.R.S. London: 1859.

Cuvier's Animal Kingdom. Part I. London: 1859.

Notes on the Dispatch of Troops by Sea. By C. J. Kirwan, Esq. Calcutta: 1859.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	30.150 in.
Mean temperature	37.6
Highest point of thermometer	49.0
Lowest point of thermometer	25.5
Mean dew-point temperature	34.7
General direction of wind	Variable.
Whole amount of rain in the week	0.00
Amount of horizontal movement of air in the week	789 miles.

TO CORRESPONDENTS.

In the First Volume of the

Medical Times and Gazette

For 1860,

A SERIES OF PAPERS WILL APPEAR

BY DR. CONOLLY,

ENTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE:

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,

SENILE INSANITY,

VARIETIES OF INSANITY WITH PARALYSIS,

UTERINE AND OVARIAN CASES,

With special relation to their Causes, as—

INTemperance,

UNSUITABLE STUDIES,

FANATICISM, ETC., ETC.

It is quite unnecessary to make a single remark upon the great interest of such a Series of Papers from so eminent a Physician, and so able a writer as Dr. CONOLLY.

Omega.—Messrs. Smith and Beck.

Impregnable.—Mr. D. is now a registered Surgeon.

H. W. C.—The pretended extract from this Journal in the *Sheffield Daily Telegraph* is an impudent forgery.

A Country Practitioner.—The inquiry shall be made of some one who keeps leeches in quantity.

Mr. Paul Jones, wishes to know what is the constitution of the Poor-Law Medical Reform Association; and who are its office-bearers. He thinks that a "real and simple organization" would soon produce "a well considered and matured plan acceptable to the Poor-Law Medical Officers, and reasonable and feasible too."

Pharmaco.—According to the experiments of M. Pottenkoffer, 100 parts of chloroform dissolve: 0.57 of morphine; 37.17 of narcotine; 4.31 of cinchonine; 57.47 of quinine; 20.16 of strychnine; 56.79 of brucine; 51.69 of atropine; 58.49 of veratrine.—100 parts of olive oil dissolve: 0.00 morphine; 0.25 of narcotine; 1 of cinchonine; 4.2 of quinine; 1 of strychnine; 1.78 of brucine; 2.62 of atropine; and 1.78 of veratrine.

Mr. Little.—MM. Bataillé and Guillet recommend Surgeons to use pure alcohol as an application to wounds, etc. They assert that the alcohol of lotions is the principal active agent in them, and they argue as follows:—Alcohol coagulates albumen, and consequently coagulates the blood, synovial fluid, serosities, etc. Applied to the surface of wounds it occasions no accidents; it there instantly coagulates the albumen, forming a greyish-white deposit. It arrests hæmorrhage from small vessels, and accelerates the secretion of plastic lymph on the surface of wounds.

Hence it favours the immediate union of wounds. It prevents the spread of phlegmonous inflammation by coagulating the albumen of the cellular tissue, and likewise prevents purulent infection. They support their propositions, as is the way with most Doctors and Surgeons, by a variety of examples or cases.

FRENCH SPELLING.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You last week gave an amusing account of the way in which a learned French author treats English names. A well-known French Medical Journal lies before me, and I just dot down a couple of like errors which met my eye in running down one of its pages. "Tunbridge-wels," "New York." I am, &c. C. T.

"SILENT FRIENDS."

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your leading article of Saturday last, you have exposed some of the malpractices of the Advertising Quacks, with respect to the treatment of so-called spermatorrhœa. I am desirous of bringing under the notice of your readers what must be regarded as a simple physiological fact, although the ignorance of its existence is remarkable even among the Profession, and still more among the public, thus affording a constant succession of victims to the quack. I mean that in perfect health, and in a perfectly chaste individual, a periodical discharge of seminal fluid is not only natural, but necessary to relieve the overloaded vesicula seminales. It is by no means uncommon to find young Medical students, when they first hear of spermatorrhœa, imagining that this periodic discharge is a form of the disease, and asking for advice for themselves in consequence; and one can imagine how much more readily it would strike an unprofessional person, who, perhaps at some early period in life may have indulged in some form of excess. In Dispensary Practice I have had several patients complaining of "wet dreams" as of a dire disease, who could hardly be persuaded that their condition was consistent with health. Many of them had diligently studied the works so constantly advertised, as was immediately discovered by their using the expressions "self-pollution," "baneful practices," etc. and the destruction of these books is, I believe, one great element of cure of the diseased mind. One man whom I induced to bring me his "Silent Friend," produced a well-thumbed copy of one of Dr. Culverwell's works, in which, besides numerous gross absurdities, there was a diagram of the male organs of generation, etc. with the rectum traversing the spinal column! I am, &c.

Sackville-st. Nov. 1859.

CHRISTOPHER HEATH,

Surgeon to the St. George's and St James' Dispensary.

COMMUNICATIONS have been received from:—

SIR G. CORNEWALL LEWIS; DR. DAY, St. Andrews; MR. ALLEN; MR. CORNEY; MR. GWYNN; DR. PARKES; DR. F. HAWKINS; MR. FRANCE; MR. COLE; MR. A. TODD; MR. STEWART; MR. HERTSLET; MR. WEISS; MR. ATCHERLEY; MR. DAVIS, R.N.; DR. BAINES; MR. MANIFOLD; DR. C. T. THOMPSON; DR. GORDON; MR. DRUMMOND; MR. HARWOOD; MR. WORSHP; MR. PARKINSON; MR. HEATH.

APPOINTMENTS FOR THE WEEK.

November 26. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

28. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Mr. Baker Brown "On Vesico-Vaginal Fistula: a New Operation for its Cure."

29. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

30. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 1 p.m.

HUNTERIAN SOCIETY, 8 p.m. Council Meeting, 7½.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Lettsomian Lectures, by F. W. Pavy, M.D., Professor of Physiology at Guy's Hospital, "On Certain Points Connected with Diabetes." With Experimental Illustrations.

HARVEIAN SOCIETY OF LONDON, 8 p.m. (Council Meeting at 7.) Mr. H. Lobb "On the Pathology and Treatment of Simple Peripheral Neuralgia."

2. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

WESTERN MEDICAL AND SURGICAL SOCIETY OF LONDON, 8 p.m. Mr. T. W. Pettigrew "On Chloroform, and Instrumental Labour."

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

By Mr. Fergusson—For Closing Artificial Anus; Removal of Growth from Tongue; Polypus of Nose. By Mr. Bowman—For Varicocele.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

S. Bowles, late Windsor & Co., Phial

and BOTTLE MERCHANTS, Dealers in Druggists' Sundries, &c., 6, James-street, Covent-garden, W.C. The cheapest house in London for every description of Medical Glass of the best quality. Samples and Prices forwarded free on application.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

N.B.—Orders sent to either Establishment will have prompt attention.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE.

Splendid Pieces for Lecturers and Museums.

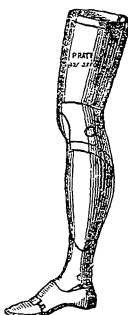

Anatomical Students are

invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS,

Surgical Instrument Maker to King's College Hospital 8, Portugal-street, Lincoln's-inn, W.C.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

TRADE MARK.

Brown & Polson's Patent Corn Flour,

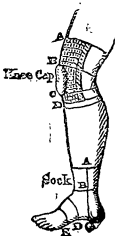

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCHMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

J. & E. BRADSHAW, late

Shoolbred and Bradshaw,

34, JERMYN-STREET,

beg to call attention to the various improvements in Patent ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE SUPPORTERS. A new description of BELT, invaluable for prevention of Cholera and the cure of Rheumatism, Lumbago, &c.

N.B. Every description of INDIA-RUBBER BANDAGE, vulcanised on the newest principle.

Directions for measurement sent by post.

N.B. A Liberal Discount to the Profession.

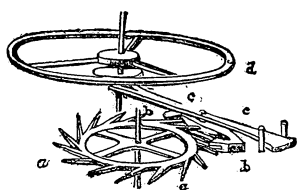

A Female to attend on Ladies.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants.

In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s. CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 30s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

LEVER ESCAPEMENT.

Benson's
WATCHES.
"Perfection of mechanism."—
Morning Post.

Send two stamps for Benson's
Illustrated Watch Pamphlet.
Watches sent free to any part
of the Kingdom on receipt of a
remittance.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

INDIA RISK ASSURANCES.

Family Endowment Life Assurance AND ANNUITY SOCIETY,

Established 1835, empowered by Special Act of Parliament. Head Office, 42, New Bridge-street, London, E.C., with Branches and Agents at Calcutta, Madras, Bombay, Agra, and Hongkong, as well as throughout the United Kingdom.

Subscribed Capital, Half-a-Million. Annual Income, upwards of £50,000. Accumulated Invested Fund, £200,000.

This Society transacts every description of Assurance business, and offers to Insurers great facilities and advantages, combined with perfect security. Eighty per cent. of the profits belong to the assured.

Parties about to proceed to India may effect insurances on highly favourable terms, and are invited to examine the Society's general and special advantages, as set forth in the prospectus of the Indian Branch.

Active Agents are required in all districts not efficiently represented, to whom liberal commissions will be allowed, and at the death of an agent one-half of the ordinary renewal commissions of the agency will (under a fixed condition), be continued to his widow or other nominee during life.

Medical men introducing business to the Society are allowed the same Commissions as are allowed to Solicitors.

Applications for agencies, prospectuses, and further information may be addressed to

EDWIN H. GALSORTHY, Actuary and Secretary.

MUTUAL LIFE ASSURANCE.

Scottish Equitable Life Assurance SOCIETY. INSTITUTED 1831.

HEAD OFFICE:—26, ST. ANDREW-SQUARE, EDINBURGH.

The Profits are divided every three years, and wholly belong to the members of the Society. The last division took place at 1st March, 1859, and from the results of it is taken the following

EXAMPLE OF ADDITIONS.

A POLICY FOR £1000, DATED 1st MARCH, 1832, is now increased to £1654 9s. 5d. Supposing the age of the Assured at the date of entry to have been 40, these Additions may be surrendered to the Society for a present payment of £363 17s. 8d., or such surrender would not only redeem the entire premium on the Policy, but also entitle the party to a present payment of £104 4s., and, in both cases, the Policy would receive future triennial additions.

THE EXISTING ASSURANCES AMOUNT TO .. £5,272,367

THE ANNUAL REVENUE £187,240

THE ACCUMULATED FUND (arising solely from the

Contributions of Members) £1,194,657

ROBT. CHRISTIE, Manager.

WM. FINLAY, Secretary.

LONDON OFFICE, 26, POULTRY, E.C.

ARCHD. T. RITCHIE, Agent.

Ford's Eider-Down Jackets for Invalid

LADIES, Young Persons of Delicate Constitution, and all who suffer from cold, to whom they are a great comfort. No other article is so light and warm; it is, therefore, a desideratum to ladies recovering from illness, as also to those used to hot climates, while for travelling or wear in the carriage during cold weather it is indispensable. Superfine cloth Cashmere lined Silk, Eider-down quilted, price Two Guineas. Sent, post free, on receipt of Post-office order and the size round chest under arms.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Ford's Aixa Jackets, with sleeves

à la Zouave, open to the corsage, may be had plain or beautifully embroidered; price in cloth, 21s.; Velvet, 42s. and 63s. The half-guinea cloth Jacket, for in or out-door wear, surprises every one for cheapness and style. Patterns and Pictures of any of the above sent free to all parts of the world.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of

BERRY, BROS, and CO. 3, St. James-street, London.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates, for cash, credit, job, or exchange. Circular of prices on application. Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting, of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebine and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.

THE MEDICAL TIMES AND GAZETTE.

THE BRITISH MEDICAL JOURNAL.

THE MEDICAL CIRCULAR.

EDINBURGH MEDICAL JOURNAL.

THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate-skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

India Office, 22nd November, 1859.

Notice is hereby given that the next

Examination of Candidates for the Appointment of ASSISTANT-SURGEON in H.M.'s Indian Military Forces, will be held in this Office, on MONDAY the 12th of December, 1859, and succeeding days, and that the probable number of vacancies to be then filled up, will be twenty-five

No. 12, Old Burlington-street.—Capital Furniture, Valuable Collection of Framed Prints, after the Old Masters, and a few Pictures and Books, the property of Sir John Forbes, M.D., &c., removing into the country.

Messrs. Rushworth and Jarvis will sell

by AUCTION, on the Premises, on Wednesday, November 30th (the house having been disposed of), the well-manufactured and useful FURNITURE; comprising the customary requisites in the bed chambers, drawing- and dining-room appendages, in rosewood and mahogany; chimney and pier-glasses, mauve curtains, Turkey, Brussels, and other carpets, Grecian lamps, range of open bookshelves, a few books and pictures, several fine prints, comprising works of Raphael, Morghen, and other esteemed engravers of the old school; fittings of hall and domestic apartments, china, glass, and miscellaneous useful effects. To be viewed the day previous, and catalogues had on the premises, and at the offices of Messrs. Rushworth and Jarvis, Savile-row, W., and 19, Change-alley, Cornhill, E.C.

City Dispensary, 76, Queen-street,

CHEAPSIDE, E.C.—A Vacancy having occurred in the office of Physician to this Charity, through the resignation of Dr. T. W. Jones, gentlemen desirous of becoming Candidates, can obtain information as to the Qualifications and other particulars, on application at the Dispensary. Testimonials to be forwarded, addressed to the Committee of the City Dispensary, 76, Queen-street, E.C., before Three o'clock in the afternoon of Monday, the 12th December next, and all applicants must attend the Committee to be admitted Candidates for the Office at Four o'clock on that day. The Election will take place on Monday, 19th December next.

By Order of the Committee,
November 15th, 1859. WILLIAM W. E. ATKIN, Secretary.

Medical.—Ledbury Poor-Law Union.

—The office of MEDICAL OFFICER of the Yarkhill District of this Union, will be VACANT on the 25th day of December next. The Board of Guardians invite the application of Candidates who possess one of the four qualifications stipulated in the Poor-Law Commissioners' Consolidated Order of July 24th, 1847. The Medical Officer will be required to reside in the town of Ledbury, and conform in every respect to the Regulations of the Poor-Law Board. The District comprises Thirteen Parishes; area 20,925 acres; population 4587. Salary £100 per annum. The said salary to be inclusive of, and in consideration of, all extra fees, payable under the General Consolidated Order of the Poor-Law Commissioners. The Guardians will provide Medicines and Appliances: also, a competent person to dispense the same. The Election will take place at the Board-Room, Ledbury, on TUESDAY, the 13th day of December next, and the person appointed will hold the Office until he shall die, resign, or become legally disqualified to hold such office, or be removed by the Poor-Law Board. Testimonials to be sent to me, on or before the 12th day of December next. Candidates to be in attendance at the Board-Room, Ledbury, on the day of the Election.

By Order of the Board of Guardians,
Ledbury, Nov. 16th, 1859. J. HUGHES, Clerk.

To be disposed of, with Immediate

Possession.—A CHEMIST'S SHOP, fitted in the best style, in a rapidly increasing neighbourhood; having been in the occupation of a Surgeon and Accoucheur for a considerable time, it will be found an eligible opening for a Practitioner, either in Town or from the Country. £300 will be required for possession. The house can be purchased or a lease granted at a yearly rent. Further particulars and cards to view between the hours of Twelve and Two, can be obtained at No. 37, St. Martin's-lane, Trafalgar-square.

Nervous or other Invalid.—An eligible

opportunity presents itself to a Lady or Gentleman, requiring a Comfortable Home, together with Medical Care and Attention, of being received by a Married Medical Man, without Family, living in a healthy picturesque neighbourhood of London. House detached. Terms moderate. Apply by letter addressed "Alpha," care of Librarian, St. Thomas's Hospital, Southwark.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Medical Registration Office.

32, SOHO-SQUARE, W.

NOTICE.—In accordance with Sect. 27 of the Medical Act, no name can appear in the next printed and published copy of the MEDICAL REGISTER which does not appear in the General Register, as existing on the 1st day of January, 1860.

November 21, 1859.

Royal Westminster Ophthalmic HOSPITAL, KING-WILLIAM STREET, CHARING-CROSS.

A COURSE of LECTURES will be delivered at this HOSPITAL, upon the Anatomy, Physiology, Surgery and Diseases of the EYE, in accordance with the Regulations of the Army and East India Boards, by HENRY HANCOCK, Esq., and HENRY POWER, Esq. The Use of the Ophthalmoscope, and the Microscopical Anatomy of the Eye, by JABEZ HOGG, Esq. To COMMENCE on 5th December, 1859, at 12.30. Fee for the Course, including Three Months' Hospital Practice, £5 5s.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 3rd of December. The Election will take place on Monday December 5th.

By Order of the Committee, S. W. WILKINSON, Hon. Sec.
Stockport Infirmary, October, 1859.

Partnership.—Wanted immediately, a

Gentleman fully qualified, and possessing energy to join a Practitioner of long standing in the establishment of a Practice in the neighbourhood of Town. As the latter is in delicate health, the former would have to take the onerous parts of the duties. In consideration of this, and of the fact of there being but the nucleus of a Practice as yet formed, no sum of money will be required, but it will be necessary that a party thus joining should be prepared to wait twelve months ere a remunerative return may be calculated on. Address, by letter only, to E. H., care of Mr. Ashby, Oil and Colour Warehouse, Coleman-street, City, E.C.

Medical.—To be Sold for £1500, or

Let for £90, that convenient Freehold Property lately belonging to and occupied by Dr. Trevor Morris, Surgeon, Chepstow. This is an unusually favourable opportunity for a man of Ability and Conduct to obtain a select and extensive Practice. Furniture and Surgery contents at valuation if desired. Address N X Y, Post-office, Chepstow.

The Succession to a First-class General

PRACTICE, Situated in a highly-respectable Market Town in the Midland Counties, and realising £800 a year, is for immediate negotiation. The House is pleasantly situated, very commodious, and well-adapted for the residence of a gentleman's family. For further particulars, apply at Mr. Bowmer's Offices, 50, Lincoln's-inn-fields, W.C.

As Companion.—The Daughter of a

Deceased Medical Man, is anxious to obtain a SITUATION as COMPANION to an Elderly Lady or Gentleman and Superintend the domestic arrangements of their household, or to take charge of any Public Establishment. The Advertiser is a member of the Established Church, is of middle age, cheerful disposition, and very domestic. Highly respectable references, both Medical and Clerical, can be given. Address to M. H., 60, Middle Abbey-street, Dublin.

PURE SPIRITS FOR THE FACULTY.

DR. ALTHAUS ON MEDICAL GALVANISM.

Price 7s. 6d.

A Treatise on Medical Electricity,

THEORETICAL and PRACTICAL. By J. ALTHAUS, M.D.

"Standard English work on Medical Electricity."—*Medical Times*.

"Exhibiting the state of the science in its most advanced stages."—*Medical Circular*.

"The entire work is one that in these days of bookmaking, it is refreshing to meet with. It is evidently the production of a philosopher, and of one who studies his profession in the only way in which it ever should be studied, in a sound spirit of inductive philosophy. And we are but discharging our duty to our readers in most strongly recommending it to their notice."—*Dublin Quarterly Journal of Medical Science*.

London: Trübner and Co., 60, Paternoster-row.

Now ready, in wrapper, 8vo, 6d.

On the Comparative Value of Certain

Salts for Rendering FABRICS NON-INFLAMMABLE: Being the Substance of a Paper read before the British Association at the Meeting in Aberdeen. By F. VERSMANN, F.C.S., and A. OPPENHEIM, Ph. D. Attached a Specimen.

of the Kingdom on receipt of a
remittance.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

Students' Achromatic Microscopes,

Complete at £3 3s. C. BAKER, of 243 and 244, High Holborn, begs to inform the Medical Profession that from the introduction of improved machinery he is now enabled to supply the cheapest and most useful Medical Microscope ever manufactured; they are fitted up complete with three beautifully-defining Achromatic Object-Glasses, that are capable of showing in a very superior manner all the usual Physiological Objects quite equal to the more expensive kind. Catalogues free by post.

Established in 1765. (Opposite Day and Martin's.)

Second-hand Surgical Instruments.—

The Largest and Cheapest Assortment in London, at C. BAKER'S, 243 244, High Holborn, also every description of new, of the best quality, at the lowest possible price: viz.—Dissecting Cases, in Ivory, 15s. 6d.; Dissecting Cases, in Ebony, 13s. 6d.; Stethoscopes, 2s.; Speculums, 3s.; Elastic Bougies and Catheters, 1s.; Enemas, from 6s. 6d.; Mendon's Teeth-Forceps, 3s. 6d.; James' Teeth-Forceps, 5s.; Midwifery Forceps, from 8s. 6d.; Lancets, 1s.; Bennett's Speculums; 12s. 6d.; Silver Probes, 9d.; German Silver-Plated Catheters, 3s.; Dressing Cases, from 17s. 6d.

All other Articles equally cheap, and warranted of the finest quality. Medical Galvanic Coils and Batteries, with Conductor, complete at 32s. 6d. Established in 1765. (Opposite Day and Martin's.)

CAUTION.

Chlorodyne.—Any Preparation advertised or sold under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals.

Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to

J. T. DAVENPORT, Pharmaceutist, 33, Great Russell-street, Bloomsbury, London.

N.B.—Medical men are earnestly solicited to attach the words "Dr. J. Collis Browne's Chlorodyne" when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.

The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner are at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebine and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S £7 7s. STUDENTS' MICROSCOPE, for which a Prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16" and 75° angular aperture, and a neat Mahogany Case about 7 in. square. The above Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

PURE SPIRITS FOR THE FACULTY.

THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

ANATOMICAL APPLIANCES.

HER MAJESTY THE QUEEN, having specially honoured Mr. HEATHER BIGG, of 29, LEICESTER-SQUARE (Author of "Artificial Limbs, their Construction and Application;" "Deformities, and the Appliances necessary for their Treatment"), with a command to Construct Mechanical Appliances for those wounded Soldiers particularly recommended to her gracious consideration, has led him to bestow considerable attention upon the scientific arrangement of such appliances; he therefore begs to invite Officers and others who are labouring under loss of limb, &c., to examine the Artificial Legs, Artificial Arms and Hands, Spinal Apparatus, &c., he possesses.

Mr. HEATHER BIGG, being conscious that the invention, construction, and application of mechanism for the treatment of deformities are frequently found to be unaccompanied by that enlarged scientific experience which such a subject requires, has recently visited the various Orthopædic Establishments of Paris, Vienna, Munich, Stuttgart, Berlin, Dresden, Cannstadt, Frankfort, &c., for the purpose of personally ascertaining what forms of apparatus were there especially adopted; thus enabling him to place at the disposal of the Medical Profession the resulting advantages.

Mr. HEATHER BIGG, having been for several years Anatomical, Surgical, and Orthopædic Mechanist to the Royal Hospitals of Chelsea and Greenwich, the Admiralty, the Hon. Board of Ordnance, the Hon. East India Company, St. George's, Middlesex, University College, King's College, Royal Free, Guy's, and St. Thomas's Hospitals, has devoted considerable time and experience to the invention, construction, and adaptation of every variety of Anatomical Appliance, and takes this opportunity of inviting the attention of the Medical Profession to the New and valuable Inventions he possesses for affording mechanical aid in cases of Talipes Varus, Valgus, Equinus, and Calcaneus; Lateral, Posterior, Rotative, and Anterior Curvature of the Spine: Inguinal, Femoral, Umbilical, and Ventral Hernia; Prolapsus Uteri and Ani; as well as every variety of Anatomical Deformity.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.
16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De Jongh, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De Jongh. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—8, Savile-row, W., August 1st, 1859."

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXIV.—Continued.

ON OVARIAN DROPSY.—ITS DIFFERENTIAL DIAGNOSIS.

3. *Fibroid Tumours of the Uterus.*—Another form of disease which it is sometimes difficult to distinguish from ovarian tumours, is one of which you have a specimen in the ward in the case of a woman who is the subject of an abdominal tumour of the size of a large adult head, rounded in form, and lying somewhat towards the right side. This tumour has very much the form and the appearance of an ovarian growth, but by studying the distinctive marks which I am about to explain to you, we have come to the conclusion that it is not cystic and ovarian in its origin, but that it is solid and grows from the uterus,—that it is, in fact, a large fibroid tumour of the uterus. From mistaking such a growth for a cystic ovarian tumour fatal practical errors have sometimes been fallen into; for it has repeatedly happened that Surgeons, and men of high standing in the Profession, believing they had to do with a case of ovarian tumour, have opened the abdomen and removed a morbid mass. After performing this operation, as they imagined, of ovariectomy, when they came to examine the tumour they have found that they had not performed that operation at all, but had extirpated a large pediculated fibroid tumour of the uterus. That operation, I need hardly add, has almost invariably ended fatally. In other cases, the abdomen has been laid open, and the operation suspended because the disease was found not to be ovarian dropsy, but a fibroid mass imbedded in the walls of the uterus. To prevent you, if possible, making such a great and grave mistake, let me request your especial attention for a few moments, while I briefly enumerate and explain the several signs and points of distinction which will enable you to establish a correct differential diagnosis between these two forms of disease.

a. *Difference in Consistence.*—Fibroid tumours are solid, massive and heavy, for they rarely contain cysts or cavities, but are usually made up entirely of solid fibrous tissues, and when such a tumour is not fixed by inflammatory adhesions, you can usually discover this characteristic of its consistence by moving it from side to side through the abdominal wall, or by examining it simultaneously through the vagina, and from the external surface. I have just said that fibroid tumours of the uterus only rarely contain cysts. Let me add that these cysts are never large. But a large fibroid sometimes grows loose, as it were, uncompact, and oedematous, and presents an imperfect and deceptive feeling of fluctuation, a state of matters, however, which is very far from being common. Ovarian tumours, on the other hand, are soft and fluctuating in the majority of cases that come before you; that is, when the smaller cysts have coalesced to the formation of one or two prominent and preponderating cavities. But when the tumours are still small, and made up of a mass of little cysts, they are more dense and elastic, and if in making your diagnosis of such a tumour, you depended too much upon the consistence of it, you would be extremely apt to fall into error, against which you must guard yourselves by attending to other distinctive marks, such as

b. *Difference in Outline.*—Although on ovarian tumours one or more projections or protuberances are often to be felt on the surface, indicating separate primary cysts, or the position of secondary cysts on the wall of the larger and principal cavity or cavities, yet, on the whole, the surface is felt to be comparatively equable and smooth. Large fibroid tumours, on the contrary, are more rough and nodulated, being made up usually of a large number of small fibrous nodules; and even where one of the masses has come to be developed so much more than all the others as to present a large extent

of smooth, uninterrupted surface, you can still frequently find a number of small fibroids growing up beside the large one. Fibroid growths of the uterus seldom, indeed, occur single. The walls of the uterus usually contain several of them at once, in different states of advancement and size. The smaller fibroids sometimes are placed on the surface of the larger of the series. More frequently they can be felt, like hard balls or masses of varying shape, seated upon or springing from other parts of the uterine surface. We never have this last characteristic symptom in ovarian dropsy—never, that is to say, smaller tumours quite separate from the large tumour. When a group of fibroids are present, the tumour which they form is usually, also, far more irregular in shape, and much more angular in outline than the comparatively spherical tumour usually formed by dropsy of the ovary. The indications derived from the contour of the tumour are thus among the most certain signs of its real nature. But they are not always to be entirely depended on. For, on the one hand, when fibroid tumours take on an enormous degree of development, and the distinctions between its constituent masses become diminished, they may, as I hinted a minute ago, come to feel almost as smooth and equable as any cystic tumour; and when, at the same time, they become soft from the infiltration of fluid, as sometimes happens in such cases, the resulting softness and apparent fluctuation may easily lead the most experienced into error. On the other hand, when ovarian tumours are still of moderate size, and at that stage, when several cysts of nearly equal size are, as it were, struggling for the pre-eminence, the prominences they present might mislead to the belief that they are uterine fibroids.

c. *Difference in Sounds heard on Auscultation.*—The stethoscope gives us one of the best marks of distinction that I know of between ovarian and fibroid tumours. On listening through the abdominal wall over a fibroid tumour large enough to reach above the pelvic brim, you can often hear a rushing sound precisely resembling the sound heard in the gravid uterus, and known as the placental or uterine bruit. This sound occurs, as we shall see afterwards, in fibroid tumours growing within the muscular walls of the uterus, and not in the sub-peritoneal variety of the disease. But I never yet heard a sound resembling that bruit on auscultating over an ovarian tumour; and indeed I never heard any sound at all except, it might be, the pulsating sounds of the large abdominal arteries. Drs. Churchill, Scanzoni, and others, have averred that they have heard a distinct bruit emitted by an ovarian tumour, but they had not an opportunity of verifying their diagnosis by a post-mortem examination; and we may still doubt whether the tumours from which the sound proceeded were really ovarian. Whenever you hear that sound, therefore, in the case of an abdominal tumour, and you know that the patient is not pregnant, you have strong reason to conclude that the tumour is a uterine fibroid, and not a cystic ovarian tumour.

d. *Difference in Relation to Connection with the Uterus.*—Careful vaginal exploration will give you some further indications of much value in enabling you to distinguish between ovarian and fibroid tumours. If the uterus be within reach of the finger, or, still better, if you can introduce a sound into its interior, you will find that in the case of fibroid tumours the whole mass can be felt through the abdominal wall to be moved from one side to the other, according to the motion imparted to the uterus by the sound; while, if the tumour be ovarian, the uterus alone is moved, and the mass, as felt through the abdomen, remains fixed and motionless. Or, on the other hand, by keeping the finger in contact with the os uteri, and making movement of the mass from without, you can decide as to their connexion from the consentaneous movements then felt; or, if the uterus remain unaffected by the movement of the abdominal mass, then you know that they are independent of each other, and that the tumour is probably attached to the ovary.

e. *Difference in Relation to Position of the Uterus.*—Formerly, I used to think that we had another sign distinctive of the existence of an ovarian tumour, when the mass was felt lying behind the uterus; not that fibroid tumours might not occupy the same position; but they are usually more diffused through the walls of the uterus, and lie as often in front as behind; and I imagined that ovarian tumours would not be found to take up a position in front of the uterus. But I

have seen several cases in which an ovarian tumour had become pediculated, and, having passed round the uterus, tilted the organ backwards and retained a position in front of it, between the uterus and the bladder.

f. Difference in Size of the Uterus.—Perhaps one of the most certain and the most reliable signs of fibroid tumours of the uterus, as distinguished from ovarian growths, is elongation of the cavity of the uterus, which is very generally present in connexion with intramural and submucous fibroid tumours. This elongation you can ascertain by passing the uterine sound. When examining a uterus which is the seat of an intramural or submucous fibroid tumour, you will find that the instrument can be pushed much further into the cavity than in cases where the womb is unaltered, and you can thus determine that the organ is spun out and enlarged like the pregnant uterus, so that instead of being only two and a-half inches long, it admits the sound for a distance of three, or even sometimes as far as six or eight inches. Such a decided enlargement of the uterus I have never found among all the many cases of ovarian dropsy that I have had occasion to examine, and I regard it as of itself almost sufficient to show the tumour to be uterine and not ovarian in its seat. Cruveilhier, indeed, has found on dissection some instances in which the uterus was enlarged in patients who had died with ovarian dropsy, but such cases, though enough to put us on our guard, are certainly rare; and I repeat, that when you find the sound passing into the uterus four or five inches, you may almost be quite certain that the doubtful tumour grows from the uterus and not from the ovary.

4. Ascites.—A large and soft ovarian tumour, distinctly fluctuating, and filling up a large space in the abdominal cavity, is not likely to be ever mistaken for the gravid uterus, or for a fibroid uterine tumour. But you will occasionally find yourselves for a few minutes in doubt as to whether in such a case you have to deal with an ovarian growth, or with a collection of ascitic fluid lying free in the abdominal cavity; and it sometimes becomes a matter of importance to know how you are to make a diagnosis between ovarian and abdominal dropsy. When you are thus doubtful of the true nature of the case, you will be guided to a correct diagnosis by various considerations, as, *Firstly*, By observing the form which the abdomen assumes when the patient is made to lie supine. Ovarian tumours, like the pregnant uterus, make the yielding anterior abdominal walls project forward in the centre, sometimes, however, in an almost angulated and irregular form; while the abdomen is usually flattened out when filled with ascitic fluid, and any bulging that exists is seen at the sides, from the tendency that the free and unencysted fluid has to gravitate to the lowest level. *Secondly*, If you make percussion over a large ovarian tumour, you will find that the sound is dull around

FIG. 2.

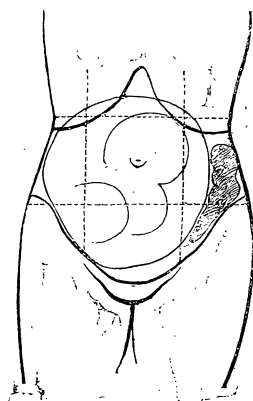

FIG. 2.—Diagram illustrative of the relation of an ovarian tumour to the descending colon. Percussion in the umbilical and hypogastric regions would give a dull sound, while at the sides and above the tones would be resonant.

the umbilicus, and over all that part of the abdomen where the tumour comes in contact with the internal surface of the

anterior wall, while at the sides and above, the intestines which have been pushed aside and upwards by the tumour, yield a tympanitic sound. If you percuss the abdomen when it is filled with an ascitic collection, on the other hand, you obtain a resonant sound in front around the umbilicus, while at the sides the sound, from the line of the water-level downwards, is dull, because the fluid has sunk backwards, and allowed the intestines to float upwards towards the anterior surface. Or if the abdomen be so much distended with fluid as to prevent the bowels from reaching the abdominal wall, and the sound emitted on percussion around the umbilicus be dull, yet by pressing the wall backwards, and thus displacing some of the fluid, you can at last arrive at the bowels, and then you will obtain the resonant percussion tone. If you have still any doubt as to nature of the case, you may, *Thirdly*, succeed in resolving it by causing the patient to move from side to side, when you will observe the free ascitic fluid shifting its position, and sinking down to the side on which the patient lies; and this change of position of the fluid you can easily detect by marking the line at which the dull and tympanitic sounds meet when the patient lies in any particular position, and finding it to vary when she turns to one or other side. On the other hand, in ovarian dropsy the relative line of dullness and resonance on percussion is not materially altered by these changes of position in the patient. In fact, you will remember easily these distinctive marks between peritoneal and ovarian dropsy, if you will merely hold in recollection,—1. That the dropsical effusion obeys in the abdomen the common laws of the gravitation of fluids to the most dependent parts; 2. That in cases of ovarian dropsy the fluid is inclosed within an isolated cyst or series of cysts, and does not move and gravitate through the general cavity of the abdomen; and, 3. That on the contrary, the effusion in ascites or peritoneal dropsy is contained within the general cavity of the abdomen, and moves from one part to another of that cavity, in correspondence with changes in the mere position of the patient; while the intestines—distended with air, and specifically lighter—float more or less on the surface of the fluid, as may readily be ascertained by percussion. There is only, let me add, one class of cases where these physical signs may prove insufficient to guide you to a correct diagnosis—those cases namely, where the peritonitic effusion is associated with a tubercular affection of the mesentery and peritoneum, or the omentum has become the seat of adhesions, which prevent the bowels from floating forward when the patient lies supine. A knowledge of the patient's previous history, and her general constitutional condition, will often serve to enable you, however, to decide between the two forms of disease; for on inquiry you will find that when the collection of fluid is ascitic in character, the patient is suffering, or has suffered at some previous period or periods, from renal, or more frequently still, from some form of cardiac or hepatic disease, which you may still be able to recognise even after the abdomen has become much distended, and that the distension has begun at the most dependent part of the cavity and spread gradually and equably upwards: while in the case of ovarian dropsical collections, the anamnesis teaches that the disease first showed itself in the form of a circumscribed and rounded growth, seated originally in one or other iliac region, and at length attaining such a size as to fill up the whole cavity of the abdomen.

5. Tympanitis of Spurious Pregnancy.—You would hardly suppose it likely that a tympanitic distension of the bowels could be mistaken for a solid ovarian tumour. Yet such an error has not unfrequently been fallen into. I was once called to see a lady of high rank, living at a great distance from this city, who had been pronounced by her Medical attendant to be the subject of an ovarian dropsy, and her family had been thrown into the greatest distress in consequence. The abdomen was very large; but on percussion, both anteriorly and laterally, it everywhere yielded not a dull but a tympanitic sound; and the supposed cystic tumour thus resolved itself into a gaseous accumulation in the intestines, which on further investigation proved to be associated with all the other symptoms that I described to you a short time ago as characteristic of pseudocyesis, or spurious pregnancy. That is an instance where a grave error in diagnosis was fallen into, but where, fortunately, no corresponding grave error in practice was committed. But such a mistake in diagnosis has led to most painful consequences when a Surgeon has cut open the abdomen with the view of perform-

ing the operation of ovariectomy in a patient whose most grave disorder was the tympanic distension of the intestines so frequently seen in cases of pseudocystitis. You may remember my telling you, when lecturing on that subject, that no less than six cases have been put on record where patients had been subjected to the dreadful operation I have just referred to, ere it was discovered that the tumour intended to be removed had no existence at all. If you bear in mind the possibility of the error, the difference of the tones elicited on percussion will always serve to guard you against the chance of making such a dangerous mistake.

6. *Hydatids*.—The variety of abdominal tumour which perhaps you will find the greatest difficulty of all in distinguishing from an ovarian growth, is one, fortunately, of but rare occurrence in practice. The tumour may be of large size, and it presents all the physical characters of a cystic ovarian tumour; but if you could have an opportunity of opening the abdomen, you would find that it was formed by a hydatigenous degeneration of the omentum. Hydatids of the omentum, then, and partial encysted ascitic collections, which are usually associated with hydatigenous degeneration of some portion of the peritoneum, form a class of tumours which no difference in physical signs, and, probably, no difference in functional symptoms, will enable you to distinguish from cystic degeneration of the ovary. In the case of the omental growth, however, you may be enabled to form a correct diagnosis by being told by the patient that the tumour began to grow high up in the abdominal cavity above the umbilicus, where it was first felt, and whence in growing it has extended always downwards; instead of beginning low down in the pelvis, and growing upwards as is seen in the case of ovarian tumours. Or if no inflammatory adhesions have taken place, you can perhaps push the tumour upwards in the abdominal cavity to such an extent as to convince you that it can have no attachment below, and that it cannot spring from any pelvic organ. In the case of the encysted ascitic collection, you can sometimes, I believe, only determine the real nature of the case by tapping the cyst, and finding the hydatigenous bodies in the fluid that escapes.

7. *Fæcal Collections in the Intestines*.—Some of you may remember, that during the winter we had in the Hospital a patient who was sent in from the country, and presented on admission the colour and appearance of a person labouring under some malignant disease. The facial expression might have led you to believe that she was the subject of a cancerous diathesis. She had a tumour in the left hypogastric region about the size of a fist. But under the use of croton-oil it readily disappeared, and proved to be only a mass of fæces in the colon. You might suppose that it would be difficult to mistake such a tumour for any kind of morbid growth, and you might imagine that the patient would be suffering from such a degree of constipation as at once to indicate its real nature. But there is not of necessity any degree of constipation present. On the contrary, there is sometimes diarrhoea. Dr. Abercrombie told me he once attended, with some other Physicians, a case where there were large swellings felt in the abdomen, and the patient suffered severely from diarrhoea. After death the swellings were found to be formed merely by hardened deposits of fæcal matter in the sacculi of the large intestine, the central tract through the bowel being left free; and that he was then in attendance upon a patient suffering from obstinate diarrhoea, who at the same time had large scybalous masses accumulated in the colon. And you can readily understand how large collections of hard fæcal matter lying long in any part of the large intestine, should at length give rise to such an amount of irritation there as to produce an attack of diarrhoea; and when this has become established, the original cause of it will readily be overlooked. The peculiar feeling of such a tumour will generally enable you to decide as to its true character: it feels like no other tumour that I know of. On being examined either through the abdominal walls or through the rectum, it is felt to be hard and resistant, but if one finger be pressed steadily upon it for one or two minutes, it will at last indent like a hard snowball, and, as there is not the slightest elasticity about it, the indentation remains after the pressure is removed. If any doubt should still remain, the persevering use of aperients will clear up for you the diagnosis by causing the mass to be dissolved and carried off.

ORIGINAL COMMUNICATIONS.

REMARKS ON INDIAN TAPEWORM.

By A. LEITH ADAMS, M.B.

Surgeon 22nd Regiment.

THERE cannot be a doubt that tapeworm is very common among European soldiers in India, and, from some cause or other, they are more subject to these disgusting parasites than the upper classes, whose means enable them to exercise greater choice in articles of food and drink. My attention was first directed to this subject during the year 1852, while serving with my corps at Rawul Paidee, in the Punjab. The regiment had been quartered for the previous eighteen months at Dugshai, on the Western Himalayas, where, in addition to an excellent climate, there was every variety of vegetable and animal food; yet during that period few cases of tænia came to my notice; but as soon as the men were settled in their new station the numbers greatly increased. Even now, after a lapse of seven years, and all the great changes a regiment undergoes in that period, I find, out of twenty cases treated within the past year, no fewer than twelve had their origin at Rawul Paidee. Within the last few years much light has been thrown on the natural history of these parasites, and some important sanitary rules have resulted from the labours of Kuchenmeister, Von Siebold, and Mr. Rainey. With reference to the production and development of the above cases, I refer in particular to the influence of measles in producing tapeworm—a fact now placed beyond the shadow of a doubt. Supposing even there are a hundred other ways and means of infection, I have no doubt in my own mind that the main, if not the only, cause of the prevalence of tapeworm in India is owing to the diseased pork. The Mohammedans do not show their abhorrence of the "unclean animal" to a greater degree than do the more wealthy classes of Europeans for that sold in the native bazaars; but the soldier, whose means will not allow him to procure more wholesome food, readily purchases the diseased meat; and when we sift the matter, it comes out that officers are very rarely affected with tapeworm, while, on the other hand, it is very prevalent among the men. Who has resided in India, and not witnessed daily disgusting scenes where herds of pigs are driven to feed on human excrement? The owners of these loathsome animals make no secret that their chief subsistence is obtained in this way, and tell you that the pigs are for the gorra log (soldier), not the saib log. It is, therefore, no stretch of the imagination to suppose that one of these pigs swallows a portion of tapeworm, when a few weeks afterwards its flesh will be charged with cysticerci: the animal is then killed, and sold to the European soldier in the form of pork, bacon, or sausages (a). In fact, I can assert, without any fear of contradiction, both from personal observation and the experience of trustworthy soldiers, that the native pork sold in the Indian bazaars is invariably measles. Now that the army of India is being organised, and a Council assembled to concert measures for preserving the health of our soldiers, we may expect the day is not far distant when, by a well-regulated sanitary police, this and such-like noxious influences will cease to exist.

Encysted flesh, if well boiled or roasted, is harmless as regards the production of tænia, for the degree of heat requisite for its preparation completely destroys the cysticerci; but it is quite possible that the former may not always be the case. The soldiers' meals are cooked by natives who have little interest in their work. In many parts of India great difficulty is experienced in procuring cattle and sheep fit for food, so that recourse is had to whatever can be obtained. The miserable specimens of the ovine and bovine races with which we often feed our Indian soldiers, bear a striking resemblance to the leanest of Pharaoh's lean kine.

With reference to the symptoms and consequences of tænia, there is much variety; some enjoy good health, though infested by worms. Many suffer from severe forms of indigestion; and, I believe, in tropical climates, chronic hepatic

(a) Von Siebold says, "The shrunk cysticerci in such sausages are very easily to be found; they form milk-white bodies of the size of a needle's head."

disease is frequently induced by tænia. Not long since, a soldier of the 50th Regiment consulted me for obstinate vomiting, jaundice, and other symptoms indicating chronic disease of the stomach and liver, for which he had been invalided from Ceylon six months before. He had suffered from the disease for three years, and during that period had been constantly in the habit of passing tapeworm with and without fæces. He was subjected to a strict Hospital regimen, and after taking the ætherial oil of fern, passed an enormous mass of tapeworms; the dose was repeated next day, but not a trace of worm appeared in the evacuations. From that date his health rapidly improved. I saw him a month afterwards, when he confessed he had not felt so well for many years, and that the symptoms had entirely left him. Probably the entire worm was expelled in this case. Experience has taught me, however, not to be too sanguine in these cases; re-appearance of tapeworm, after months of apparent immunity, is a constant occurrence, in spite of the most powerful and efficacious remedies.

Although many persons affected with tænia appear to enjoy good health, yet, on minutely examining their cases, it is seldom we do not find dyspeptic symptoms accompanying them, and the longer the parasite remains in its host, the more marked these symptoms become; for it is rare to find the digestive organs regular,—relaxation of the bowels and flatulence are of frequent occurrence after slight irregularities in living. The appetite may be bad, voracious, or craving, but easily satisfied. A sensation of nausea on getting out of bed was a very constant symptom in a great majority of cases under my care. Vertigo and perverted vision are pretty constant. One of my patients complained, in addition to severe symptoms of gastric dyspepsia, of affection of vision, so that he had been, for many years, in the habit of observing black spots before his eyes, and at times objects under their level appeared obscured in a dark cloud, while everything above was clear and distinct. These sensations entirely left him after the expulsion of the worms by oil of fern with oil of turpentine, and he continued free from the above symptoms for ten months afterwards. A case somewhat similar occurred in the practice of my friend Dr. Leared, of the Great Northern Hospital, London, who is disposed to assign the affection to a true organic disorder of the brain. In a paper published in the *Medical Times and Gazette* of January 15 last, I adverted to a well-marked expression of face and constitutional symptoms characteristic of the worst cases of tænia in bad constitutions. Many of these cases, in spite of the most efficacious remedies and after masses of worms have been expelled, obtain only temporary relief for a few weeks. On these occasions abundance of neck-pieces are observed, which doubtless belong to several individual worms, and in this way I account for the very intractable nature of certain cases met with in practice. I have treated several hundred cases, and, except in two, the head could not be found; the obstinacy with which it clings to its host after the loss of every segment up to the neck—the rapidity with which reproduction takes place, the constant passage of segments without fæces, accompanied by continual tickling at the sphincter, together with the general appearances of the segments lead me to the conclusion that all my patients are infested by the *tænia medio canellata* of Kuchenmeister. I have found, however, that the segment is no certain means of distinguishing the species, as segments of the same worm had their median stems and branches agreeing with descriptions of *tænia solium* and *tænia medio canellata*. A head, however, agreed in every particular with Kuchenmeister's description of the latter, and has left no doubt in my own mind that this is the common tape-worm of India. The tænia of the Hottentots resembles apparently this species; there is, therefore, a similarity between the Indian and African which it is important to settle, in order that their difference or identity may be fixed. My experience has been confined almost without exception to such as originated in India. Consequently these observations do not apply strictly to the tænia of this country, which, judging from authorities, is a more manageable parasite, and expelled with greater certainty; whereas, on the other hand, the constant annoyance caused by the passage of segments, and the wonderful rapidity by which reproduction takes place after enormous quantities have been expelled, show that the *tænia medio canellata* is much more injurious to its host.

The following case is interesting:—

Private A. G., aged 29; stout and healthy; had been passing tapeworm for six years; they appeared in his evacuations shortly after his departure from Rawul Paidee, in the Punjaub. He acknowledges to have been in the habit of eating measled pork and sausages, when quartered in the above station. They pass away from him almost daily when at rest, but oftener when walking; he has morning sickness, and frequently sudden and transient vertigo, a craving for food, and a sense of uneasiness at the verge of the anus. Large doses of powdered kamala were administered shortly after the appearance of the parasite, but afforded only temporary relief. Admitted July 14, 1859. Diet, milk. Pulv. jalapæ c., ʒj.; calomel, grs. iv. M. The effect of this purge was to bring away several small segments. On the 15th, tinct. kamala, ʒiv.; ol. felicis æth., ʒij. M. Bowels opened several times; passed on each occasion enormous coils of tapeworm, and many neck-pieces, and the head, which is not larger than that of a large pin, with two minute black spots. It agrees in every particular with the unarmed head of *tænia medio canellata*, as described by Kuchenmeister. Dr. Leared has since confirmed the identity by microscopical examination; and I have the rare satisfaction of being enabled to pronounce a cure in this case. Now three months have nearly elapsed since its expulsion without any indication of a relapse, and the total disappearance of the concomitant symptoms which used to annoy my patient.

I believe success in the treatment of tænia has been very much overrated; letting alone quacks, scientific investigators have, doubtless, in many instances, been led away by the apparent good results of their remedies. How often does it happen that after the expulsion of large coils of worm, the patient experiences great relief and for weeks imagines his cure completed, when by degrees the old sensations recur, and segments are seen in the evacuations which daily increase in numbers until he becomes even worse than before. Cases are not uncommon when enormous coils are expelled by anthelmintics every three months. How long the parasite will stand this breaking up, and whether the same head continues for years to furnish segments, are points yet undecided.

The researches of the German helmenthologists, Kuchenmeister and Von Siebold, show that a remarkable metamorphosis takes place before the eggs of the tænia are capable of producing the perfect parasite, that these eggs do not become true tapeworms in the host, but having emigrated from the infested animal, they find their way into others and there undergo the change from which the tænia results. What I have already said with reference to the feeding of pigs in India is one example of the mode of reproduction. Von Siebold says, "There are many kinds of intestinal worms in whose eggs the embryo is never hatched if they remain in the place where they have been laid. These young must then either wait for, or seek an animal to lodge in, having entered into which, they are capable of attaining sexual maturity. For example, what would happen if the millions of eggs that a single tapeworm can produce were to develop and generate their young in the same intestine in which they were laid?" Although the most intimate intercourse exists between soldiers living under the same roof, eating their meals together, and sleeping in close apposition, I have not met with a new case of tænia, since the arrival of the regiment in England, now a period of four years. All were of Indian origin; for out of twenty treated by me within the last year, twelve were of nine years' standing, four of fifteen, and three of eighteen years' duration. Has the growth and continuance of the tænia for these long periods been owing to a permanent vitality of the head or have they been reproduced directly from the eggs in the intestines of their host?

Nothing can be more fallacious than the supposition that Indian tænia is certain to be completely expelled by even the most careful regimen, and the most powerful remedies. In order to secure success there must be a carefully-conducted regimen before and during the administration of remedies; the slightest error in this respect detracts wonderfully from the certainty of the action of many anthelmintics. After trials of various modes of treatment, I find the following the most efficacious:—For ten or twelve hours no solid food is allowed, then a drastic purgative is given, which has the effect of expelling several segments; after the purging has ceased, a draught of tincture of kamala, ʒiv.; æthereal oil of fern ʒij., in ʒij. of mucilage, is given, and repeated daily

until all traces of the worm have disappeared from the evacuations. During the treatment tea and toast, or rice and milk, only are allowed. Usually after the first dose large coils of worm are voided, with neck-pieces indicating the strength of the combination. When either remedy was used singly, or oil of turpentine, it was seldom that neck-pieces were voided; moreover, the intervals between the expulsion and reappearance of the worms were much longer by the above plan than any other I have tried. As to the relative value of these remedies in Indian tænia I consider the ætherial oil of fern far superior to any anthelmintic I have used.

I am disposed to place oil of turpentine before kamala, although the latter seldom fails in expelling quantities of worms, it is not certain in its action even when given in large and repeated doses. Santonina alone or combined with calomel has very little effect on Indian tænia. Frequent disappointments in the results of all remedies I have hitherto tried, and constant applications for relief from my unfortunate patients, have induced me to try a plan, suggested by Dr. Leared, of giving doses of fern or kamala at short intervals, with an occasional drastic purge, in hopes that by a regular and continued course of annoyance the head of this most obstinate parasite may be compelled to detach itself. I have given this mode of treatment a trial in upwards of six cases, but hitherto without success. I fear there are few patients will submit to the frequent discomfort occasioned by the medicine.

ON THE RELATIONS OF BELLADONNA AND OPIUM, AND ON POISONING BY BELLADONNA.

By JAMES SEATON, L.R.C.S. Edin., L.A.C.

THE following cases, which occurred in my practice in September, 1858, will, I hope, prove interesting to the Profession, as illustrating the symptoms produced by belladonna in poisonous doses, and showing the relation which exists between that poison and opium. I was led to the use of opium by the perusal of a paper read by Mr. Benjamin Bell, before the Medico-Chirurgical Society of Edinburgh, and which appeared in the *Edinburgh Medical Journal* of July, 1858.

Two young men having gathered about a pint of the ripe fruit of the atropa belladonna, which they found growing in an old quarry a few miles from Leeds, on their arrival home they distributed them among their friends, believing them to be innocuous. The cases which follow were the result of their imprudence. The berries appeared to be ripe, were in size a little less than a small cherry, and were described to have a mawkish, sweet taste.

J. W., aged 23.—On September 12, 1858, at a quarter-past seven p.m. took ten berries; at eight p.m. complained of dryness of throat, and great difficulty in swallowing, followed by indistinctness of vision, and pain in the head and eyeballs, which felt as if starting from their sockets. These symptoms were followed by delirium, characterised by intense wakefulness and vivacity, and a want of coherency in his ideas and speech.

At half-past ten p.m. took an emetic, which induced free vomiting, notwithstanding which the symptoms persisted. At two a.m. on the 13th, was ordered a dose of castor-oil, and tinctura opii, m vij. every four hours. At five a.m. slept for a short time, but on awaking was still delirious; took the medicine every two hours up till two p.m., when he fell asleep and awoke two hours afterwards quite collected. The indistinctness of vision in this, as in the other cases, continued several days. The pupils which, before sleep, were widely dilated, on sleep being obtained became contracted to the ordinary size.

J. R., aged 23. At seven p.m. on September 12, took five berries, at eight had dry throat and tongue, great lassitude, and inability to walk. At ten p.m. vomited freely from the action of an emetic. I saw him at 11 a.m. on the 13th, when he still complained of pain in the head and eyeballs, giddiness, and dimness of sight. The pupils were dilated, but there was no delirium. Took no medicine.

W. R., aged 25. At seven p.m. on September 12, took eight berries; at eight o'clock had dryness of throat and tongue, with the other symptoms above described. At eleven p.m. took an emetic, and vomited. He passed a sleepless night, and continued more or less delirious up till five p.m. on the 13th, when he was seen for the first time by my assistant, who ordered him tinctura opii m x. every two hours. After the third dose he fell asleep, and on awaking in the morning felt much better, and was quite collected.

H. W., aged 22. At seven p.m. took eighteen berries; at a quarter past eight the symptoms became developed; at nine p.m. took an emetic, which induced free vomiting. This patient suffered very little, and took no medicine.

J. E., aged 7 years. At half-past seven p.m., on September 12, took six berries; at nine had dryness of the throat, followed by the other symptoms. At two a.m. on the 13th vomited spontaneously. Was first seen at eleven a.m. on the same day, when he was intensely delirious and wakeful, being continually busy with some imaginary occupation. Was ordered tinctura opii m viij. every hour. The medicine was continued the whole day, but the delirium continued unabated. At twelve p.m. the dose was doubled, in the form of morphia, and two and a-half hours afterwards he fell asleep, and continued so till seven a.m. on the 14th, when he had an evacuation per rectum, and again slept for two or three hours, after which he awoke quite sane. The pupils, which had been widely dilated, became contracted when sleep was obtained.

C. C., aged 14. At eight p.m., on September 12, took two berries; at nine the symptoms of poisoning supervened; passed a sleepless night, and did not vomit; was seen at seven a.m. on the 13th, when he was ordered a dose of castor-oil, and tinct. opii m viij., every two hours. As the delirium continued unabated at eleven a.m., was ordered tinct. opii m xvj. every hour, and the medicine was thus given up till seven p.m., when he fell asleep, and continued so, with slight intermissions, till five on the following morning, when he awoke, all his more serious symptoms having disappeared. The same condition of pupil was observed in this as in the other cases.

E. W., aged 46. At seven, p.m., on September 12, took twelve berries; at eight the symptoms commenced; at half-past ten became delirious, and continued so till half-past four, a.m. On the 13th, when I was sent for, she was ordered a dose of castor-oil, and, immediately on taking it, vomited freely for the first time. She was also ordered tinct. opii m viij. every two hours. As the delirium continued undiminished, at nine, a.m., the dose of opium was doubled, in the form of morphia, and given every hour. The medicine was thus continued, and the symptoms persisted without any material alleviation, till ten, p.m., when she fell asleep, and awoke in the morning quite collected.

T. W., aged 8. At seven, p.m., on September 12, took five berries, and had similar symptoms. At seven, a.m., on the 13th, was ordered tinct. opii m vj., to be taken every two hours; at eleven the dose was doubled, and ordered every hour. He continued sleepless and delirious up to twelve, p.m., when he fell asleep, and awoke in the morning quite collected.

J. W., aged 12. On September 12, at seven, p.m., took two berries, but did not vomit; during the night was sleepless, delirious, and had all the other symptoms of poisoning. At five, a.m., on the 13th, had a dose of castor-oil, and was ordered tinct. opii m vj., to be taken every two hours. At eleven, a.m., the dose of opium was doubled, in the form of morphia, and given every hour. The delirium continued intense during the whole day and following night, although the dose of opium was gradually increased, and it was not till half-past seven, p.m., on the 14th, that sleep was obtained. He then slept during the whole night, and when he awoke had all his more serious symptoms relieved. This patient was thus wide awake and excessively active for forty-eight hours after taking the berries, and, before he slept, had taken equivalent to twenty-four grains of opium.

S. W., aged 14. About seven p.m. on Sept. 12th took berries, but the exact number is unknown. Had the same symptoms as already described. At three a.m. on 13th she vomited. At seven a.m. was ordered castor-oil, and tinct. opii m viij. to be taken every two-hours. At eleven a.m. the dose was increased to m xij. every hour up till four o'clock, after which she took no more medicine. From four till seven p.m.

she continued delirious, but having intervals of complete unconsciousness; after seven she fell into a state of total insensibility; at ten she was incapable of being roused, and at twelve p.m. died in a comatose condition. The pupils, at the moment of death, were so widely dilated as to render the iris scarcely visible.

Post-mortem, thirty-seven hours after death.—The external appearance of the body was that of a subject of scrofula. The limbs attenuated, and considerable swelling of the face from carious bone. The superficial vessels of the brain were slightly congested. A section of the organ showed the vascular points to be scarcely, if at all, more developed than natural. The ventricles were empty, the substance firm, and the arachnoid perfectly glistening and transparent. Both lungs were entirely adherent to the walls of the chest, the result of old pleurisy. Structure of the heart pale and flabby; valves healthy, and the cavities filled with fluid blood. The blood in the large vessels was very dark-coloured, and flowed out like water on their being divided.

The stomach was partially distended with gas, and contained about an ounce and a-half of yellowish fluid, and a small piece of undigested apple. The mucous membrane was somewhat paler than natural, except two or three small spots of very slight congestion, situated near the pyloric orifice. No appearance of inflammation was observable. The mucous membrane of the intestines was also perfectly healthy. A number of seeds were found scattered over the surface of the duodenum and jejunum, and near the middle of the latter a whole berry was seen. The contents of the bowels were of a black colour, owing to the patient having been taking iron medicinally up to the period of her death.

It would appear, from the above cases, that the violence of the symptoms did not correspond with the number of the berries taken, as J. W., who had only two, was very alarmingly ill; while H. W., who had eighteen, escaped with scarcely any bad effects. The reason probably is, that, while in the one case the berries were completely absorbed, in the other they were vomited before sufficient time had elapsed for their digestion. The first symptom appears to have been dryness of the mouth and throat; next, indistinctness of vision and dilated pupil; and, afterwards, in the more severe cases, delirium supervened. I found in one man, who had only swallowed one berry, the dry mouth and fauces without any affection of vision. The indistinctness of vision was the most persistent symptom; in all the cases it existed to a greater or less degree for several days, and the boy C. C.'s vision continues defective up to the present time. The delirium was of a busy, restless, vivid character, but generally rather pleasing than otherwise. The patients appeared to think that they were pursuing their ordinary occupations; one boy appeared eager in flying a kite; another pulled tables and chairs about, thinking he was working in a coal pit; while the woman, E. W., appeared to be remarkably busy with her ordinary household duties. All their movements were of a quick, excited character strikingly resembling delirium tremens. There was no very marked vascular excitement, the skin was, in most of the cases, moderately cool, and the pulse rapid, but without power.

The remarkable tolerance of opium in these cases would appear to bear out the conclusion at which Mr. Bell, Dr. Graves, and others have arrived: that opium and belladonna mutually counteract each other. In none of the cases in which delirium was present, were the symptoms alleviated until sleep was obtained; and, after sleep, the patients felt comparatively well. The pupils were widely dilated so long as the delirium continued, and, when sleep was obtained, were either contracted or reduced to the natural size.

With regard to the fatal case, I may mention, that she was decidedly scrofulous, and had been under treatment for several months for disease of the bones of the face. It will be observed that she took much less opium than several of the cases which recovered, and that, at the moment of death, the pupils were very widely dilated.

The post-mortem appearances are chiefly valuable for their negative testimony. The condition of the brain appeared to be as nearly as possible perfectly natural; as was the mucous membrane of the stomach and intestines. The only thing which was abnormal was the remarkable fluidity of the blood in every part of the body.

53, Kirkgate, Leeds.

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

KING'S COLLEGE HOSPITAL.

THE following are brief accounts of some of the operations performed at King's College Hospital on Saturday last:—

POLYPOID (?) DISEASE OF THE ANTRUM AND NARES.—REMOVAL.

(Under care of Mr. FERGUSSON.)

Mr. Fergusson removed a polypus from a man, aged 69. The following is a brief notice of his remarks on the case, and explanatory of the operative procedure. The polypus had eroded the nasal process of the superior maxillary bone, and appeared on the face through the side of the nose beneath the eye, involving also the skin in this position. It was of doubtful nature—it might be called common gelatinous or fibrous polypus, or it might be malignant. These cases are frequent, and occur generally in advanced life. The prospect of this case was unfavourable on account of the advanced age of the patient and also the extensive nature of the disease. A better chance would have been given by earlier removal; but as removal was the only chance left, and as the patient earnestly desired that something should be done to relieve him, Mr. Fergusson decided to remove it, and he expected that, though it would probably return, still he believed that the patient would enjoy a period of comparative comfort. Since the introduction of chloroform, operative interference in these cases was more warrantable. Mr. Fergusson first laid open the nostril, and found then that the disease implicated the antrum. He next removed a portion of the anterior wall of this cavity, and by the fingers, etc., he scooped out the diseased mass. On inspection after removal, some portion looked like soft cancer, and some like ordinary gelatinous or fibrous polypus. He stated that he had frequently seen the nostril laid open, and as the disease was found extending to the antrum, the nostril was stitched up, and the operation abandoned. He had, however, lately been in the habit of pursuing the growth, and in removing it completely. In the case of a young man, some years ago, a patient in King's College Hospital, he found, as stated, that on removing a polypoid mass from the nostril, the finger passed into the antrum. In this case he cleared out the cavity. In three months it recurred in the same position, and when the nostril was completely occluded, the operation was again performed, and every point was freed from the disease. It healed well, and the man, who has been seen once or twice a-year, is still free from the disease.

VARICOCELE.—LIGATURE AND SUBCUTANEOUS SECTION.

(Under care of Mr. BOWMAN.)

The patient, a young man, had suffered from the disease (varicocele of the left side) for six months. The pain in his testes, loins, etc., prevented his following his employment. In August Mr. Hulke passed a needle under the vein, and applied a ligature. The needle came away in eight days. Several abscesses formed in the neighbourhood, the irritation of which has only just passed off, but the varicocele still remained.

Mr. Bowman stated that the operation was based on exactly the same principle as that of subcutaneous ligature of veins for varicose ulcers (*vide infra*). He passed two needles, an inch apart, under the veins, carefully keeping the vas deferens with the artery away, and then applied the ligature over them, just tight enough to occlude the cavity of the veins, but not to cut them. The veins were then divided between the needle by a tenotomy-knife, the wound made being very small. A pad was next placed over the incision. Mr. Bowman stated that he had treated varicocele by this method on several occasions with very satisfactory results. There was no hæmorrhage, nor did suppuration follow, and thus there was no chance of pus, and also none of decomposed blood, being absorbed into the system. He should remove the lower needle probably on Monday, and the upper one on Wednesday last. The neuralgia would probably remain for a little time after

the operation. He stated that atrophy of the testis, so frequent in varicocele is, due to impaired nutrition from obstructed circulation, the same condition precisely existing in varicose ulcer, and both also remediable by the same means, viz., obliteration of the varicose veins.

[November 30.—To-day Mr. Bowman removed the second needle, the lower one having been removed on Monday. The man is doing well. There is no suppuration.]

VARICOSE ULCER,—LIGATURE AND SECTION OF THE VEINS.

Mr. Bowman now directed the attention of the gentlemen present to the case in which he had operated a fortnight ago, for the cure of varicose ulcer, by ligature and section of the veins of the leg. The patient was now free from pain, which previously had been severe. The sore—now not half its former size—was healthy, florid, and granulating, its edges smooth, and the neighbouring tissues had lost their brawny hardness, and become supple and soft. The parts concerned in the operation healed well, and the operation in every respect had proved quite satisfactory.

POLYPUS OF THE EAR.—TREATMENT BY TORSION.

(Under care of Mr. BOWMAN.)

A woman, aged 30. She had had the disease six years. It had on one occasion been partly removed, but was now of large size and extended from the meatus. It was covered with cuticle and was quite firm. Mr. Bowman had punctured it, and evacuated some serum, and thus reduced its size; but it was soon again as large as ever. Mr. Bowman said that it was impossible to state with certainty the point from which it grew, but it was probably the membrana tympani. Various methods of treating polypus of the ear were in use. Soft ones were removed in the same way as polypi of the nose, or their neck was ligatured by an ingenious instrument contrived for that purpose. He remarked that, considering that the canal was narrow and curved, the latter methods were of doubtful value. It was necessary to use great caution in extraction; for if, as often happens, the polypus grows from the membrana tympani, this structure would be destroyed, the tympanic chain of bones might also be destroyed, and even death ensue by disease extending from the petrous portion of the temporal bone to the brain.

On Wednesday Mr. Bowman commenced the treatment of the case by slow torsion. He transfixed the extruded part by a needle, and then gave it a twist. He gave it another twist to-day. One effect on the tumour of this procedure was to render it livid and almost black, showing the immediate effect on the circulation of the mass. Mr. Bowman hoped that by this means he should cause ulceration of the neck of the tumour, and thus ensure its safe and complete removal.

CLINICAL REPORT ON FAVUS.

WERE FAVUS a common disease, instead of being, as it is, an exceedingly rare one, it must long ago have taken its place in that short category of diseases of which we may assert that they are thoroughly understood, and need no further description. It is, in all its stages, and under every aspect, so peculiar in itself, and so different from every other skin affection, that it is impossible for anyone who has once become familiar to ever feel in doubt as to its diagnosis. In nine cases out of ten its history would enable a skilled dermatologist to pronounce positively as to its nature without even seeing the patient; to the naked eye its characters are so marked, that neither history or microscopic examination are requisite; under the microscope, the smallest fragment of its crust, again, at once reveals its nature: we may, indeed, go further, and assert that, in a majority of cases, neither microscope nor even eyes are needful, a well-trained olfactory sense being amply sufficient. Under these circumstances, the differences of opinion and confusion of statement which we still encounter in authors respecting it, and in witness to which we may refer to quotations given below, are at first sight extraordinary. The fact is, however, that the real disease is, and always has been, very infrequent, and that not a few have written descriptions of it who plainly had before them other and much more common affections; while of those who have been correct and exact in

diagnosis, almost all have written from the observation of a very limited number of cases.

In proof of our assertion, that although the disease is, in its nature, most definite and uniform, yet that startling discrepancies exist respecting it in the opinions of the Profession, we shall cite, in juxtaposition, the opinions of certain writers as to several of the more important facts in its clinical history.

OPINIONS OF WRITERS.

IS FAVUS A STRUMOUS DISEASE?

"Tinrea favosa (favus) is said to occur chiefly in the scrofulous, those mentally weak, and those in bad health; Jacobs was certainly neither scrofulous nor mentally weak, and his health was excellent."—*Dr. Jenner's Clinical Lecture* (1853).

"One, the essential nature of which consists in the deposition of that heterologous formation called tubercle."—*Mr. Erichsen* (1842).

"It will be sufficient for me to show you in one group the favus patients who are now in our wards, in order to convince you that, with the exception of a few scrofulous children, the subjects of this disease are all of a robust constitution."—*Bazin, "Des Teignes,"* p. 82 (1858). (a)

"Defective nutrition is the real cause of the disease."—*Mr. Erasmus Wilson* (1847).

"To favour its propagation poverty and sickness must have reduced the living body to a state fit to constitute the nidus for a parasitic plant."—*Dr. Corrigan* (1845).

DEGREE OF FREQUENCY OF FAVUS.

"It is a very rare disease in Ireland, according to my experience."—*Dr. Corrigan* (1845).

"In the course of my long connexion with the St. Pancras Infirmary, I have seen not more than six cases of favus."—*Mr. Erasmus Wilson* (1847).

"Favus is, next to eczema and impetigo, the most common of the chronic diseases of the scalp. The complaint is very common in England."—*Rayer*.

"Tinrea favosa (favus) is fortunately rather a rare disease in England."—*Dr. Jenner* (1857).

IS FAVUS CONTAGIOUS?

"The contagiousness of favus is an established fact."—*Gibert*.

"Favus is a contagious disease, and is readily communicated among children who make use of the same comb and brush."—*Rayer*.

"Essentiellement contagieux."—*Cazenave*.

"I believe it is not contagious."—*Dr. Corrigan* (1845).

"It spreads rapidly by infection through families of children."—*Mr. Samuel Plumbe* (1821).

"My own careful investigations have forced on my mind the conclusion that favus is not contagious."—*Mr. Erasmus Wilson* (1847).

"Favus is the only true and real contagious disease of the scalp. . . . There cannot be the least doubt that it is very frequently, and very readily, communicated by contact."—*Mr. Erichsen* (1842), "*On Diseases of the Scalp*."

"Favus is evidently contagious, but in some cases the attempt to produce infection has entirely failed."—*Biett*.

The discrepancies which are to be found in our standard writers upon the subject being so wide, we propose in the following report to bring the disease in question to the only test which can afford a satisfactory and final decision. Gathering our facts from the very extended field afforded by the London Hospitals, we are able to bring together a much larger number than could have been obtained in the same period at any single one. These cases will be submitted to cautious numerical analysis, and the inferences from them carefully, but definitely stated. By this means we trust to obtain a wide basis, not of opinion, but of fact. In order to increase our series as much as possible, we have included in the following table all such cases as we could find recorded by other writers, in sufficient detail for our purpose. The number of original cases in the subjoined table is thirty-eight; six have been under the writer's own observation, and the particulars respecting them have been noted by himself. It may be well to add that in all, with but two or three exceptions, the microscope was employed to confirm the diagnosis.

JONATHAN HUTCHINSON.

"(a) Il me suffirait de vous montrer réunis les teigneux qui occupent nos salles pour vous convaincre qu'à part quelques enfants scrofuleux, ces malades sont tous d'une constitution robuste."

TABULAR STATEMENT OF FORTY-FOUR CASES OF FAVUS.

Number.	Name, Station in Life, Hospital.	Age.	Temperament, State of Health.	Whether of Strumous Diathosis.	History of Phthisis or Struma in the Patient's Relatives.	History as to Contagion.			Age at which it began.	Duration.	Parts affected.	Progress under Treatment, Remarks, etc.
						Caught it.	Gave it.	Degree of Exposure.				
1	Wm. R. a neglected orphan.—Hospital for Diseases of the Skin.—Mr. Startin	8	Although he is reputed delicate, he has never had any definite illness	There are no signs of strumous nor phthisical aspect; he has, however, rather thick alae nasi	No	Said to have done so	No	Very great	5	3 years	It began on the top of the head and spread, but never affected other parts	Treated by sulphur ointment for three weeks, after which no favus crust could be detected; he also took iodides and tonics.
2	John G., a Scotch boy, a tramp.—Hospital for Diseases of the Skin.—Mr. Startin	15	He lives badly (vegetables chiefly); dirty in his habits, etc.; well-grown, and healthy-looking, but has not been so well since the small-pox	No	No	No	No	He sleeps with two brothers	13	2 years	It began on the occiput and spread gradually over the part of the head covered by hair only, except a little behind	He says, "the small-pox left it."
3	Stephen C., Irish.—St. Thomas's Hospital.—Dr. Risdon Bennett	11	Stout, well-grown; lives chiefly on vegetables	No	No	Yes (?)	Yes	He did not give it to his brother, with whom he slept, but to a child in the Hospital	It involves the whole scalp, and perhaps on the back of the hands	He fancies that he caught it from a boy in a workhouse. He was discharged "cured," but was seen six weeks afterwards as bad as ever.
4	Aaron I., German Jew.—London Hospital	12	Pale and pasty complexion	No	No	No	Great	9	3 years	The whole scalp is covered; it never extended to other parts; microscope not used	
5	Mary S.—Hospital for Diseases of the Skin.—Mr. Startin	9	The child pretty-well developed, but is said to be getting thinner	No positive symptoms, but upper lip rather thick	Her mother's relatives are consumptive	No	A sister said to have it	Very great	8	9 months	It began on the head; there are only a few spots without crusts elsewhere	
6	Wm. H., shoeblack.—Hospital for Diseases of the Skin.—Mr. Startin	15	Stout and strong	No	No	No	No	He sleeps with his brother, who has never caught it	12	3 years	It began at the top of the head, and extended to the whole scalp; no other parts affected	It has been got apparently well often, but has always returned.
7	Mary Ann H.—Hospital for Diseases of the Skin.—Mr. Startin.—Feb. 9, 1852.—M.B. iv., p. 11	11	Has had delicate health, but looks fairly healthy; dark complexion, brown eyes	No note	No note	No	No	Much exposed	1 (?) 7 (?)	10 (?) years 4 (?) years	It extends over the whole scalp; hair not diseased, and still firmly fixed	It was doubtful as to the age at which it began. The child had an eruption from early infancy, but it had not spread or assumed its present character until within four years.
8	Maria E.—Hospital for Diseases of the Skin.—Mr. Startin.—Feb. 14, 1853.—M.B. iv., p. 16	11	Healthy-looking; probably a Jewess, but the note does not state	No note	No note	No	No	No note	10	6 months	The whole scalp is covered, and in some parts the hair is destroyed	
9	Mary Ann S.—Hospital for Diseases of the Skin.—Mr. McWhinnie.—1853.—M.B. v., p. 13	14	A neglected child. It followed measles. She appears to be in good health	No	No	No	No	Great	Scalp covered	In this case there were patches of tinea tonsurans on the body. These patches were cured by the sulphur ointment. Her scalp was kept clean as long as she used the ointment patiently. She remained under observation several years.
10	Eliz. J., Guy's Hospital.—Dr. Barlow.—M.B. v., p. 27.—Feb. 4, 1853.	14	Stout, tall, florid	She was of healthy appearance	No note	No	No	Much exposed	2	12 years	Vertex of the scalp covered	She used the unguentum metallorum of the Guy's Pharmacopoeia; and the scalp was cleaned; but a year later, she came under treatment at the Hospital for Diseases of the Skin, as bad as ever. She attended at the latter for more than a year, and was still not cured.
11	Eliza H.—Hospital for Diseases of the Skin.—Mr. Startin.—M.B. v., p. 42	17	Fair complexion; rather delicate looking; she has never menstruated, and looks younger than she is	No note	No note	No	No	Much exposed; slept with her sister	16	1 year	Almost the whole scalp is covered; some bald patches	

12	John R.—Hospital for Diseases of the Skin.—Mr. Startin. M.B. vi., p. 3	5	Fair complexion	No note	No note	No note	No note	No note	No note	No note	No note	No note	5	3 weeks	Patches of favus on the buttock, mixed with patches of poringo	(In this instance, the disease began on the boy's head first, and on the girl's a few weeks afterwards. They had seven brothers and sisters, with whom they habitually slept, played, etc.; but no communication of the disease to them had ever taken place.
13	Willm. R.—Hospital for Diseases of the Skin.—Mr. Startin. —M.B. vi., p. 23	17	Fair complexion. Small of his age	No note	Said to have caught it	No	Has slept with his brother, but never gave it	2	15 years	Scalp						
14	William C.—Hospital for Diseases of the Skin.—Mr. Startin. —June 17, 1853. —M.B. vi., p. 36	7	Said to have never been well since he contracted the disease; he was healthy before	No note	No	See next Case (his sister)	Great	4	3 years	The top of the head, with a fringe of hair all round						
15	Eliz. C.—Hospital for Diseases of the Skin.—Mr. Startin. —June 17, 1853. —M.B. vi., p. 36	5	Like her brother, this child is said to have been delicate ever since she had the disease	No note	She caught it from her brother, and about the same time	No	Great	2	3 years	Affects the upper part of the scalp						
16	Hannah McM., Irish. —Hospital for Diseases of the Skin.—Mr. Startin. —M.B. vi., p. 42. —M.B. ix., p. 10	16	She had good health before the attack, but never since. Accustomed to live well	No note	No note	No note	No note	13	3 years	Covers the top of the scalp						
17	Aaron L., Jew.—Hospital for Diseases of the Skin.—Mr. Startin. —April 6, 1853. —M.B. vi., p. 42. —M.B. ix., p. 10	12	Florid, and in good health. Well-fed and cared for	No	No	No struma or phthisis in his family	Very much exposed	11	14 months	Covers the whole scalp, excepting a border of hair on the forehead	Two of her brothers were stated to have had it, and to have got well after about a year's treatment. The disease in the girl was not well characterised, but the microscope placed it beyond a doubt. This boy had been a month in St. Thomas's, in the same ward with the subject of Case No. 3, with whom he was very intimate. By means of the compound sulphur ointment the disease was kept in abeyance, but a year after the first note it was still uncurd. The crust was removed, and fuming nitric acid was applied to the part. The result was a cure.					
18	Mary Ann P.—Hospital for Diseases of the Skin.—Mr. Startin.—M.B. ix., p. 16.—Dec, 1852	11	Fair complexion; florid	No	Caught it from her brother	No	Much exposed	..	Some years	On the vertex of head

26	Isaac C. Jew. — Metropolitan Free Hospital. — Mr. Hutchinson. — Case Book O. Case No. 2424	18	Dark complexion; healthy	The glands in the neck are slightly swollen, but his aspect is not strumous	No struma in his family	Yes	No note	No note	A brother and sister are stated to have had it, and have got well
27	Patrick K., Irish. — Metropolitan Free Hospital. — Mr. Hutchinson. — Case Book N. Case No. 2743	12	No note	No note	No note	No	No	No note	10	2 years	Over the whole scalp; much of the hair destroyed	
28	Hyman J., Jew. — Metropolitan Free Hospital. — Mr. Hutchinson. — Case Book M. Case No. 4290	20	Excellent health; dark complexion; stout	No	No note	No note	No note	No note	17	12 years	Small spots of favus scat- tered over the whole scalp; no patches on the body	He had been under Dr. Jenner's care three years before, and subse- quently under that of Dr. Barker, in St. Thomas's Hospital. When under Dr. Jenner, he had large patches on the body; after Dr. Jenner's treatment (sulphurous acid) he remained well for two years.
29	Chas. P. — Metropoli- tan Free Hospi- tal. — Mr. Hutchin- son. — Case Book L., p. 295. — Nov. 26, 1858	18	A neglected lad, of dirty habits	Has had inflamed glands under the jaw, the scars of which remain	No note	No	No	No note	2	16 years	Over the whole scalp	He had been under treatment at St. George's and St. Mary's Hos- pitals, but without permanent benefit.
30	Mary Ann P. — Me- tropolitan Free Hospital. — Mr. Hutchinson	2½	In good health	No	No	No	No	No note	2½	2 weeks	A single patch on the back	The patient, her sister, and two cousins, had tinea tonsurans on various parts of the body; none on the scalp. The patch of favus was destroyed by fuming nitric acid. Permanent cure.
31	Eliza H. — Hospital for Diseases of the Skin. — Mr. Startin. — Register ii. p. 21. — March 24, 1853	12	Healthy	No note	No note	No note	No note	No note	5	7 years	On the scalp	The mother of these patients had suffered from favus, which had left her at the age of 22. She stated that her father and her grandmother had also suffered from the same disease. For fur- ther details see remarks under the head of Contagion.
32	Harriet H., sister to the above	7	Healthy	No note	No note	No note	No note	No note	..	3 months	On the scalp	This woman was married, and had five children; but neither they nor her husband had caught the disease. She lived in an isolated country village, and had never seen any one with a like affection.
33	Mrs. F. — Mr. Hutch- inson	24	Healthy	No	No	No	No	Much exposed	6	18	Patches on the vertex of the head; the other parts being bald	The compound sulphur ointment seemed to keep the disease down, and ultimately to cure. The child is now free from the disease, which has, however, left large bald patches, with shining cica- tricial-looking surface.
34	Fanny McC. — York and District Union Workhouse. — Mr. North. — Nov., 1859	9	Health not bad; but when first seen a year or less ago, she was a "squalid, miserable- looking" child	Decided strumous diathesis. No active struma.	No history	No note	No	Very great. The child was not kept from the others in a large work- house. No other child caught it	Scalp	
35	Isabella F., servant girl. — Royal In- firmity, Edinburgh. — Dr. Bennett. — May 6, 1849, to Jan. 17, 1850	22	Somewhat stout; fair skin	Scrofulous aspect	No note	No note	No note	10	13	Scalp covered	She was treated by the local applica- tion of cod-liver oil, pitch, and sulphur, after removal of crusts, but the disease always re-ap- peared,

36	Margaret B.—Royal Infirmary, Edinburgh.—Dr. Bennett.—June 19, 1849	Cachectic	No note	No note	No note	Said to have arisen from using a comb belonging to a girl who had a sore head	3	Numerous and dense crusts on scalp, in small groups, and is isolated on temples, forehead, and occiput. The scalp is bald in patches.	Crusts removed, and surface kept moist by an alkaline lotion. Early in July she took 3ss. of cod-liver oil three times a-day, and used the same locally; an oil-silk cap being also used. She was dismissed cured on August 10. She was re-admitted for five days on Sept. 5. The disease had not re-appeared.
37	Helen G.—Royal Infirmary, Edinburgh.—Dr. Bennett.—Nov. 3, 1853	No note	No note	No note	No note	No note	4	A great portion of the scalp was bald, from destruction of hair-bulbs, but the other portions were covered by friable crust and crowded by pediculi	She had been frequently in the Infirmary before. She was treated by the sulphurous acid lotion, and the disease had not returned on Feb. 5.
38	Margaret C.—Royal Infirmary, Edinburgh.—Dr. Bennett.—July 22, 1849	No note	No note	Caught it from Isabella F. (Case 35), a patient in the same ward	Great	No note	A few months	Scalp	She was admitted for eczema impetiginodes on July 23, 1849. She caught favus, as stated, in August or September. She was treated by cod-liver oil internally and externally, and was discharged apparently well on Dec 6. The microscope was used. The whole was cauterised with nitrate of silver. Cure.
39	James S., a painter. Royal Infirmary, Edinburgh.—Dr. Bennett.—January 27, 1856	No note	No note	No note	No note	No note	Week	A circular reddened spot about the size of a shilling, with favus crusts in the centre, over the external angle of the left nasal bone	She was admitted several times, and oleaginous and other remedies were tried.
40	Charlotte C., a Hindu girl.—Royal Infirmary, Edinburgh.—Dr. Bennett.—June 20, 1857	No note	No note	No note	No note	No note	As long as she can remember	Scalp bald in patches. The hair is filled with scales easily detached. Towards the back of the head these scales were enclosed in a diffused friable yellowish matter, "which, under the microscope, presents the "thallus" and sporules of fungus"	She says that she has never seen any one with a similar disease. Children in the workhouse had ringworm, but she never caught it.
41	Mary A. B., a poor girl, formerly in a workhouse. Hospital for Diseases of the Skin.—Mr. Sturth.—Nov. 28, 1859	Fair complexion. Health good	Flat nose; thick lips	No note	No note	Her sister used to sleep with her	10 years	It extended over the vertex, leaving a circle of hair quite free. It is now, however, neatly clean, leaving bald patches	
42	William M.—Dr. Corrigan	No note	No note	No note	No note	No note	1 year	It covered a large extent of the scalp	
43	Thomas F.—Dr. Corrigan	"A fine healthy boy"	No note	No note	No note	No note	11	It covered the whole scalp	
44	William L., stable-boy.—Dr. Corrigan	Good	No note	No note	No note	No note	7	It occupied the greater part of the scalp	

FIRST-RATE LEECHES.—Of all the plagues which beset the traveller in the rising grounds of Ceylon the most detested are the land leeches. They are not frequent in the plains, which are too hot and dry for them; but among the rank vegetation in the lower tranches of the hill country, which is kept damp by frequent showers, they are found in tormenting profusion. These leeches never visit ponds or streams, but in moving they have the power of planting one extremity upon the earth and raising the other perpendicularly to watch for their victim. Such is their vigilance and instinct, that on the approach of a passer-by to a spot which they infest, they may be seen among the grass and fallen leaves on the edge of a native path, poised erect, and preparing for their attack on man and horse. On desecrating their prey they advance rapidly by semicircular strides, fixing one end firmly, and arching the other forward, till by successive advances they reach and occupy the traveller. Sir Emerson presents us with a picture of these leech evolutions, which is simply shocking to the reader's serenity, especially when he bemoans that they

insinuate themselves so imperceptibly that the first intimation of their onslaught is the trickling of the blood or a chill feeling of the leech when it begins to hang heavily on the skin from being distended by its repast. Furthermore, their numbers are such that they constitute a serious danger, for when the Kandyan were in rebellion, in 1818, the soldiers, and especially the Madras Sepoys, with pioneers and coolies, suffered so severely from this cause that numbers of them perished. Horses are driven wild by them, and stamp the ground in fury to shake them from their fetlocks, to which they hang in bloody tassels. The bare legs of the palankin-bearers and coolies are a favourite resort, and, their hands being too much engaged to be spared to pull them off, the leeches hang like bunches of grapes round their ankles; and "I have seen," says Sir Emerson Tennent, "the blood literally flowing over the edge of a European's shoe for their innumerable bites." We believe it is no uncommon incident of a journey to have to detach some 50 to 100 of these pests at its close. Such is one of the many drawbacks which its varieties of insect life attach to a residence in Lanka—"the resplendent,"—*Tennent's Ceylon*.

SATURDAY, DECEMBER 3.

THE COLLEGE OF SURGEONS AND ITS NEW ELECTS.

No sophistry can turn wrong into right, and an ill deed is best mended by timely owning the evil and going back into the true way. A few years ago one of our colonies was threatened by the Home Government with an importation of convicts. A cargo was incontinently despatched. Righteously, and with an indignation which we can now in some measure sympathise with, the lawful citizens remonstrated and resisted. It was unendurable that loyal and honest men should have thrust upon them the presence and keeping of those who had lived in open violation of the laws of their country, who till their conviction had thriven by imposture and preying on the weakness and ignorance of others. Happily the cry and the demonstration were heeded; the orders for disembarkation were recalled, our hand was stayed in the committal of a national injustice, and order and good feeling were restored as the next fair breeze wafted the pestilential mass away over the Southern Ocean.

We have recently seen a similar wrong committed on a small scale, among ourselves, even in spite of warning, and with a pleading of spurious equity which places its utterers in one or other of two false positions. They must be either incapable, or unworthy of their trust. We have in late numbers explained to our readers that the College of Surgeons not long ago admitted to a modified examination, and granted Diplomas of Surgery to, two applicants who had in no way complied with established regulations; the one, a Druggist, the other, a Surgeon's Assistant: and that, not content with these specific acts of injustice to their duly-qualified Fellows and Members, the Council, in an official letter to the protesting Practitioners of Dudley, openly declare themselves "obliged to relax their rules for a limited period, in favour of certain persons who have practised many years, and who, in the opinion of the Court, would have been unjustly excluded from the Register." The Council also acknowledge that they have "admitted to examination persons whose Surgical and general character has been certified by competent Practitioners." And all this is "owing to the highly penal clauses of the Medical Act."

About the facts and intentions there can be no dispute. It is with the injustice and impolicy of these proceedings that we have now to do. Nor ought we to overlook the Jesuitical device by which we are to be decoyed into acquiescence with this infringement of our rights. "In common with several of the Medical Corporations in the United Kingdom," we adopt this course. Is it so? Are the examiners of the College of Surgeons really following any lead? No doubt the new bye-law of the College of Physicians is here more directly alluded to. But wherein is the community of action? Does the College of Physicians propose to admit, or has it ever admitted, men to its membership who have had no Medical

education, who have complied with no curriculum, who have obtained no reputable degree? It is true many of their new members have not fulfilled all the letter of the old requirements; but all of them have been either Doctors of Medicine, or among their own extralicensitiates, and not only certified by "competent Practitioners," but by members of their own body. Is any standard equivalent to this set up by the College of Surgeons for its new elects? Far from it. And herein lies the injustice of the deed. Its impolicy follows as surely as a shadow. Bad comes of bad as a natural consequence. There is no averting it, and a few tinselled rags of false liberality thrown over it only make our disgust the more. Let us look at this point all round. The wrong spreads over the whole mass of the Profession. Physicians, Surgeons, Apothecaries,—whether English, Scotch, or Irish,—are all equally injured. Whatever the qualification may be, it has been obtained according to rule, and the enclosure of professional privilege has been entered by recognised portals. Have not all a right to complain when they find a back-door suddenly opened, and intruders forcing their way in the crowd? A cur may steal in occasionally notwithstanding the vigilance of the best keepers; but a string of black sheep must be let pass by treachery. The public is imposed upon. Faith is broken with the people. Why are Charters granted? Princes can only depute their powers to others in such matters, and when "our trusty and well-beloved" Council betray their trust, who is to blame, and who may rightfully accuse?

But of all others the Fellows and Members of the College have the fullest ground for murmuring. They have sought the Diploma as an affair of honour. It confers no special privileges. Its distinction is one which has sprung from the accumulated self-esteem and mutual respect of its elects. No one ever thinks of the official frippery as a source of dignity to the main body. To have elected a well-certified layman as President would not have been an act so outraging propriety as the unfair introduction of any member. But not to speak of men in the position of Examiners, Council, or Presidents, who may indulge their whims with impunity, and without ever having their equanimity rified by being hustled in a rush of Professional impostors; take the case of a private Surgeon, who has throughout life endeavoured to regard the obligations of his College oath, who remembers the years of his own study and Hospital practice, and who, having now sons to educate, looks over the long list of things to be done and time spent by the young aspirant for Surgical honours, and prides himself upon the thought that he has spared no pains to render them equal to what is demanded of them. This man too has his social position. He has perhaps stood better with the public because of his relation with the College, and it may be that circumstances have called upon him to point out to a Board of Guardians, or a Bench of Magistrates, the distinction between his own qualifications and the miserable pretensions of some illegal Practitioner who has ventured to beard the poor helpless Society of Apothecaries by driving a trade of quackery in his neighbourhood. Nevertheless these "persons" are often successful in their way, and "have practised many years" and find it in their power to induce even "Competent Practitioners" to certify as the College exacts. What does the College then do? Admits them to membership and equality with their former opponents! On the next public occasion our regular friend finds himself in a false position. Present equality overrides all antecedents. He can say no more. The Council have decided upon his degradation. He is garrotted by a ticket-of-leave man.

This concrete way of dealing with the matter is the one which brings out most plainly the features of its injustice. We trust that even the President's seat is not too far off for him to see and loathe them.

THE WEEK.

POISONING by misadventure still flourishes, thanks to our Druggists; and we may safely prophecy that it will never cease flourishing until the Legislature has determined that no one shall deal or meddle with those sharp-edged tools,—poisons,—who has not proved himself capable of understanding their nature and their deadly qualities. Here is another specimen of what our *laissez-faire* Legislature patronises; it is the old tune, played on an old instrument:—

“On Wednesday the Bradford coroner held an inquest on the body of Samuel Edmonson, aged nine months, whose death was caused by the administration of oil of bitter almonds, supplied to his parents by a druggist's boy in mistake for oil of sweet almonds. After a lengthened investigation the jury came to the following verdict: ‘That the child died from the effects of a deadly poison called essential oil of bitter almonds, having been sold to his parents for the oil of sweet almonds, and administered by them to him with a good intent; and the jury consider Mr. Cookson, the druggist, was highly blameable for permitting an inexperienced and very ignorant youth to sell the poisonous drug which caused the death of the deceased.’ A minority of the jury, including the foreman, was at first in favour of returning a verdict of manslaughter, but eventually all concurred in the verdict above recorded.”

A strange case of attempted wholesale poisoning by cantharides is recorded in this week's journals. The coachman of the gentleman in whose house the affair took place purchased, as it turned out, an ounce of cantharides, and deliberately mixed it with the beer and coffee of the family. Five of the servant maids were seriously affected, and so also the master and mistress of the establishment. All of them have happily recovered. Is it possible that this is one of those strange cases of coincidence or of the effects of example on ill-conditioned minds? Our readers will remember that a short time ago an extraordinary case of murder came before the public, in which it was suspected that cantharides was the fatal agent. Had the coachman taken the idea from this?—Then at Canterbury we have a case of poisoning by mistake, by a Druggist, who seems to have sold a draught containing a third part of laudanum for a black draught, and killed a young man in twelve hours. As the Druggist has been committed to take his trial for manslaughter, we need not say more about this case at present. The public have been startled to find that, but for a circumstance almost accidental, at least two other unfortunate persons whose death is now the subject of inquiry, might have gone to their graves and no suspicion been excited that their death was other than a natural one; for it is certain that, had not the accused, by his conduct and voluntary statements, set the inquiry afoot, it never would have taken place. In many cases where the poisonous black draughts were swallowed they produced great pain and vomiting, which lasted many hours; but, the poison having been thus thrown off the stomach, death did not follow.

Two years ago the Royal Commission appointed to search into the regulations affecting the sanitary condition of the Army, reported that “the treatment and care of lunatic soldiers had constituted an important branch of their inquiries.” The chief difficulty the Commission had to contend with in reference to the subject, was the provision for one class of permanent lunatics. Those who had friends, or whose parishes could be ascertained, were discharged, and sent to them; but those who were without friends, and whose parishes could not be traced, had to be dealt with otherwise. This residue constituted the principal stumbling-block. Prior to the late war these unfortunates had been sent to a Government Hospital at Yarmouth; since the war they have been sent to a private establishment at Bow. The accommodation, however, soon proved to be insufficient, and what then was to be

done? “Build a special asylum for these lunatics, and the lunatics of the Indian Army,” said the Commissioners in Lunacy. “No,” said the Secretary of State for War; and the Royal Commission approved the decision, and expressed the opinion that it would be better “to trust, as at present, to civil establishments for the permanent reception of military lunatics.” Well, then, you will say, obtain additional accommodation in other asylums. But the Commissioners in Lunacy had testified with a high voice, before the Royal Commission, against the iniquities of private asylums, and they did not approve of county asylums for soldier-lunatics. The military authorities could not, therefore, think of dealing so hardly with their lunatics as to send them to such places. Bow was a necessity, but the evil of that place was sufficient for the time being. The happy inspiration then seized the War-Department to turn the friendless and parishless lunatic adrift in the streets, and leave him to the fostering care of the parochial authorities. Nay more, if these were not sufficiently prompt in acting the part of the Good Samaritan, the War-Department was prepared to hold them up to general reprobation. Mark the result. It so happens, that all lunatics liable to be discharged from the Army are sent to Fort Pitt, Rochester, before being finally dealt with. Hence, if the course adopted by the War-Department could have been successfully carried out, there would have been forced upon that city the whole of the friendless lunatics of the British Army, amounting to some forty or fifty annually. The overseers naturally declined this responsibility; and on Saturday, the 26th ult., by the instructions of the Secretary of State for War, they were charged before the local magistrates for neglect of duty in not taking care of a lunatic who had been turned adrift from Fort Pitt a day or two before. The Magistrates unanimously dismissed the charge, and the War-Department has been righteously foiled in this disgraceful attempt to brow-beat and over-awe the parish beadle. Cannot the law shield the unhappy lunatic from the sufferings he is exposed to by this unjustifiable conduct of the military authorities? We trust that the Commissioners of Lunacy will take up this question, for we understand that they are making inquiries into the recent case at Rochester, and have expressed their disapproval of the course adopted by the War-Department.

The annual meeting of the Northumberland and Durham Medical Registration Society was held last week in Newcastle, and was numerously attended. The objects of this Society are threefold: first, to assist the Medical Registrar in discriminating between the legitimate and fraudulent claims of candidates for Medical Registration, and to suppress illegal Medical practice within the range of the Society's jurisdiction; secondly, to scrutinise the working of the Medical Act, and to urge on the Legislature such alterations and additions to it as may for the future be thought advisable; and thirdly, to urge on the qualifying Boards of this country the adoption of such extensions or improvements in the system of Medical Education as may from time to time be recommended to them by the Medical Council. It was stated that the numerical strength of the Society was verging on 200, being about one-third the number of the members of the London Association. It appears that the Society have been subjected to some abuse on the part of certain local periodicals, on account of a rule now in existence tending to exclude Homœopathic and other quacks from their ranks, although such persons may possess Medical titles. A motion was made at the meeting by a Dr. Glover, for the purpose of rescinding this very wholesome rule; but the unlucky proposition met with no support from the meeting, and it fell to the ground for the want of a seconder. The Society very properly argue that they act on the

broad principle that the members of the Profession who embrace Homœopathy have openly abandoned and reviled the Medical faith believed in and practised by every Practitioner at present attached to the Society, and which Medical faith every Medical Board in Great Britain insists that all candidates for legal qualifications shall understand and believe. The Society, therefore, had unanimously resolved that they were justly entitled to exclude from their ranks men who, morally considered, were no longer members of the common Profession, although the law secures them certain legal privileges. It will be well for the Profession if every Medical Association in the United Kingdom, and indeed throughout the civilised world, should adopt the same rule as that of the Northumberland and Durham Medical Registration Society, for it is of course a mere delusion on the part of the public to suppose that the globulistic absurdities have anything in common with the principles of legitimate Medicine, and it is therefore only fair that honest and sensible Practitioners should repudiate the Homœopathic doctrines and their professors. With regard to the prosecution of unlicensed Practitioners, the Society appears to be acting firmly, but with prudence and caution, taking summary proceedings against those who, since the passing of the Act, are practising without any qualification, and palming themselves off upon the public under assumed titles; urging others, who having passed through a due course of study, but practising without having received their qualifications, to procure their legal titles as soon as possible; but dealing gently and leniently with those who are advanced in years, and who, though not legally qualified, have passed in former time through a regular course of Medical education. The Northumberland and Durham Society have been invited to join the London Medical Registration Society, but they have declined to do so on the terms proposed, although they express their willingness to co-operate in the most cordial manner with their London friends. The last business transacted was the reading of a memorial to the Secretary of State for the Home Department, on the subject of the death of a man who appears to have died through the improper interference of a clergyman, and who was buried by the same clergyman without any Medical certificate. The man was suffering under double pneumonia, and was attended by a regular Medical Practitioner; but at the instigation of the clergyman, he was wrapped in a sheet steeped in cold water, by which treatment the disease and the life of the patient were both speedily terminated. The Society merely requested the Secretary of State to allow an inquest to be held, but the Right Honourable gentleman had given no answer to the memorial. We have thus detailed at some length the chief proceedings at a late meeting of the Northumberland and Durham Medical Registration Society, because we believe that the transactions of so large and respectable a body of Medical Practitioners will exercise a beneficial influence upon the progress of reform in the Medical Profession.

LEEDS MEDICAL REGISTRATION ASSOCIATION.—At a large and influential meeting of the Medical Practitioners of Leeds and its district, held in the Lecture-room of the Leeds School of Medicine, on November 25, C. G. Wheelhouse, Esq., in the chair, it was finally determined that a Medical Registration Association should be formed under the above title. It was resolved—"That the objects of this Association shall be to prevent unqualified persons becoming registered, to obtain the removal of the name of any person who may have obtained registration by fraudulent means, and to prosecute unqualified practitioners; that this Association affiliate itself upon the London Medical Registration Association, and thereby avail itself of the advantage offered by it of a public prosecutor." Other resolutions of detail were passed and a committee appointed to report to a general meeting.

REVIEWS.

An Account of the Life, Lectures, and Writings of William Cullen, M.D. By JOHN THOMPSON, M.D. Two vols. Edinburgh: 1859.

THE first of these two large volumes was published so far back as 1832. The second volume now appears, having been commenced by Dr. J. Thompson and Dr. Wm. Thompson, and concluded by Dr. David Craigie. And sadly, therefore, and curiously enough it happens, that the two Thompsons, father and son, who begun this life of Dr. Cullen have both passed away before its completion; and have had their own biographies appended to its pages. Lord Cullen was to have written his father's life, and having all the materials in hand and an intimate acquaintance with the history of Dr. Cullen, was the proper person for the task. He declined many offers from Medical men, who offered to undertake the life, and at last died, as it seems, without having made any progress whatever in the execution of his design. After Lord Cullen's death Dr. Thompson, who had not himself personally known Dr. Cullen, was requested by the family to undertake the life.

Of these two large volumes the first, and about one-half of the second, were written by Dr. Thompson and his son, and to Dr. Craigie we are indebted for the remainder. There is not to be found in them much of the private life and personal history of Dr. Cullen, but rather an account of, and analysis of, his writings. Indeed his editors complain that the facts and reliable information which they were able to obtain relative to his life were few; and little chance is there of gratifying curiosity now that Cullen's only grandson is approaching the age of fourscore years!

But Dr. Cullen was a public man, and his intercourse with the Profession at large and the public will be found fully detailed in these volumes. It is, of course, impossible for us here to point out the influence which Dr. Cullen exercised in his generation upon the progress of the Medical Profession, or to do more than give a mere outline of what this Life of Cullen offers to the readers.

His early struggles are interesting; but he seems always to have played a cautious game in the struggle, never trusting too much to the accidents of fortune. His intercourse and correspondence with the great men of his own and other countries were considerable; and if we are not mistaken, the letters of these men to him, and of his to them, will be generally considered as forming not the least interesting and instructive part of the work. However well told and analysed may be the history of Medical Science in the hands of Stahl, of Hoffmann, or of Whytt, it really is hard, in these advanced days of physiology, to sit down and calmly investigate and discuss the opinions, doctrines, and ideas of such learned men. There is really no time to give to such things. Those, however, who will dive down a little into the labyrinthic tale, will learn in what a chaos physiology reposed before the days of Cullen.

In the first of these volumes will be found an account of Cullen's birth and parentage, his education, his travels, his connexion with Glasgow, and his removal to Edinburgh. During this first part of his life he was much given up to Chemistry. At Edinburgh he commenced his famous Clinical Lectures; and at length succeeded Dr. Gregory in the chair of the Practice of Physic. Throughout his career he seems to have been most happy in the friendship of the great professional men of his day,—a fact clearly shown by his correspondence with them. His abilities and zeal also won for him the respect of his fellow-citizens. This Life of Cullen, from his wide connexions and broad scientific labours, is in reality almost a history of the Medicine of his days. No one can take it up without finding matter for instruction and amusement. His enlarged views respecting the position which Medicine ought to occupy, on education, and on professional dignity, do him the greatest credit. His was no narrowed soul. Chemistry, Botany, Agriculture, Materia Medica,—in all these he was well skilled, as well as in the Practice of Physic.

To the Profession generally these volumes are full of interest; but they will be found especially so to our Scotch brethren—Dr. Cullen's own countrymen.

Guy's Hospital Reports. Edited by SAMUEL WILKS, M.D. and ALFRED POLAND. Third Series. Vol. V. London: 1859.

THE rich store-house of knowledge accumulated in Guy's Hospital is again made available, in the present number of the Reports, for diffusing a large amount of practical information among the members of the Profession. It is evident that the interests of Medicine are greatly promoted by the contributions from our Metropolitan Hospitals, either in such Special Reports, or in the wider publicity afforded by these columns, and that the truth or falsehood of Medical doctrines will best be established by the evidence of results afforded by patients under actual treatment. In these extensive fields of observation the symptoms of disease are accurately noted from day to day, and the effects of treatment are carefully recorded; and, when the cases terminate fatally, the revelations of the dead-house are invaluable in clearing up doubts, and in confirming or contradicting the diagnosis made during life.

Among the more important papers in the present number, are a long and able Report on Injuries and Diseases of the Nervous System, by Mr. Thomas Bryant; a collection of cases of Morbus Addisonii, Melanæmia, Anæmia Idiopathica, Leucocythemia Splenica et Lymphatica, by Dr. Wilks; a paper on Lesions of the Nervous System producing Diabetes, by Dr. F. W. Pavy; the third series of Contributions to the Practical Surgery of New Growths or Tumours, by Mr. John Birkett; some cases of Aneurism of the Cerebral Vessels, by Dr. Gull. In Dr. Wilks's paper the first case adduced is one of disease of the supra-renal capsules attended with bronzed skin, and the writer defends Dr. Addison's theory of the connexion between the organic lesion and the cutaneous discoloration, with great ability, notwithstanding the serious objections which have lately been urged against it. Thence he proceeds to consider other cases of discoloration and decoloration of the cutaneous surface, in connexion with diseases of internal organs, especially of the liver and spleen; and he adduces some facts from Frerich's work on the Liver, in illustration of the influence of that organ in modifying the blood-pigment.

Among the shorter papers are one on a case of Contraction of the Oesophagus from Corrosive Poison, in which the operation of Gastrotony was performed by Mr. Cooper Forster, and although unsuccessful in its results, the operation was sufficiently satisfactory to encourage the repetition of the operation in similar unfavourable cases. A few cases of Poisoning follow, which have occurred in Guy's Hospital since the last Report, the poisons being respectively solution of chloride of zinc, sulphuric acid, soap-lees, and alcohol; a series of cases illustrative of the Treatment of Rheumatic Fever, by Dr. G. Whitley, who arrives at the conclusion that the alkaline treatment is, on the whole, the most efficacious; a paper on some points in the Diagnosis of Heart-Disease, by Dr. Barlow; and some contributions to Dental Pathology, by Mr. S. J. A. Salter. The number is illustrated by several well-executed engravings, some of which are coloured.

Illustrations to "How to Work with the Microscope." By LIONEL BEALE, M.B., F.R.S. Containing upwards of 150 separate figures. London: 1859.

This little work consists of a series of plates, twenty-eight in number, illustrating Dr. Beale's book, entitled "How to Work with the Microscope." The engravings consist principally of diagrams, showing the construction of the instrument, and the various accessory apparatus employed by the microscopical inquirer. A few figures, however, are introduced, representing the microscopical appearances of some common objects, such as chalk, particles of wood, flannel, etc. which are often found on the object-glass, and which might mislead the investigator.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.—The following gentlemen will be balloted for, as Fellows of this Society on Tuesday evening, December 13th, 1859. The Ballot will be opened at half-past seven o'clock, and will close at half-past eight precisely:—Richard Barwell, Frank Chance, William Howship Dickinson, Edward Long Fox, John McIntyre, Henry Hunter Raymond, Charles Williams, and Joseph Williams.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE NORMAL HYPERTROPHY OF THE HEART DURING PREGNANCY.

By M. LARCHER.

THE point the author here wishes to bring under the notice of the Profession, he has had ample means of investigating at the Paris Maternité, for his investigations have been extended to 130 pregnant women, the great bulk of whom succumbed to puerperal fever—no lesion having preceded or given rise to the condition of the heart observed in them. The conclusion he comes to is, that the heart is normally in a state of hypertrophy during gestation. The walls of the left ventricle become increased by at least from a fourth to a third in thickness, its texture being also more firm and its colour more bright—the right ventricle and the auricles retaining their normal thickness. These observations, made by M. Larcher, date back some thirty years, and have been confirmed by subsequent ones, made with great exactitude, by M. Ducrest, upon 100 other women: but why this paper has been so long in being published no explanation is given.

Within certain limits this condition of things may co-exist with the maintenance of health; but it none the less may be taken to express a predisposition to congestions and hæmorrhages. If, as the general rule, the hypertrophy gradually disappears after parturition, it may be otherwise in exceptional instances, especially where the recurrence of pregnancy has been frequent, and with short intervals. Is this not a cause of the varied lesions of the circulatory apparatus so commonly met with in women who have borne many children, either at too premature an epoch, at too brief intervals, or during an unfavourable condition of health? There is every reason, too, to believe that the bronchitis, which is so common during pregnancy, derives much of its character of persistency from this condition of the heart. Again, may we not attribute to this the greater danger of pneumonia when developed in pregnant women, and the frequency with which abortion then occurs? The various forms of hæmorrhage met with in pregnancy, as epistaxis, hæmoptysis, metro-rhagia, and apoplexy, are likewise predisposed to by this hypertrophy, normal though it be. Although pregnancy may, in the majority of cases, suspend or render slower the progress of pulmonary consumption, the progress of this affection becomes accelerated after delivery, and the still hypertrophied heart increases the perturbation of the respiratory apparatus.—*Archives Générales*, tome xiii. pp. 291—306.

ON ULCERATION AND PERFORATION OF THE APPENDIX VERMIFORMIS.

By M. LEUDET.

M. Leudet terminates an interesting memoir upon this subject with the following conclusions:—1. Perforation of the ileo-cæcal appendix is so much more common than is that of any other part of the intestine, as to equal in frequency all the other perforations of the canal taken together. 2. Ulceration of the appendix is very frequent in pulmonary phthisis, accompanied by lesions of the cæcum, and even in chronic enteritis. 3. The causes of the perforation are the ulcerations in enteritis, those in pulmonary phthisis (six times in thirteen), typhoid fever, foreign bodies, and perhaps in some rare cases the eruptive fevers. 4. A lesion consecutive to the perforation is generalised peritonitis, which is, fortunately, rare, since it occurred only in one of forty-three cases. Circumscribed peritonitis is much more common, and may be confined to the adjacent nooses of intestine, or between these and the abdominal wall. The purulent collection may consist in an abscess of the iliac fossa, either sub or supra-aponeurotic, attended with the usual consequences. Other and rarer terminations are the opening of the circumscribed peritonitis outwardly, or adhesion of the appendix to, and its communication with the small intestine, cæcum, rectum, bladder, or internal iliac artery. Abscess of the liver and phlebitis of the vena portæ are sometimes consequences of the perforation; and in other cases, the adhesions which limit the

peritonitis may give rise to fatal strangulation of the small intestine. 5. The symptoms of perforation vary according to the consecutive accidents. It may be latent, especially in phthisis. 6. The perforation is susceptible of cure, and it only causes rapid death in a small number of cases. 7. Its diagnosis is difficult; but it may be suspected when symptoms of partial peritonitis in the right internal iliac fossa come on, in individuals who until then were in good health, or who are the subjects of phthisis or chronic enteritis. 8. In these cases purgatives and glysters must be abstained from, the best treatment consisting in employing opium and belladonna in large doses, with tepid baths, and limiting the amount of fluid drank.—*Archives Générales*, tome xiv., p. 327, 328.

EXCERPTA MINORA.

Glucosuria in Marsh Fevers.—M. Burdel thus concludes a memoir upon this subject:—1. A true diabetes exists in marsh fevers. 2. It is only ephemeral; *i. e.*, being the evidence of the disturbed state of the economy, it appears, persists, and disappears with the fever. 3. It is the expression of the special disturbance of the equilibrium prevailing between the cerebro-spinal and sympathetic nervous systems. 4. M. Claude Bernard's explanation is confirmed by these facts. 5. The more violent the paroxysm, and the more intense the shivering, the greater is the amount of sugar. 6. On the other hand, the greater the number of paroxysms which have taken place, and the more these have lost their force,—when, in fact, the cachexy has become established, the less is the quantity of sugar.—*Union Méd.*, No. 139.

Alum Lozenges in Affections of the Throat.—M. Argenti, of Venice, proposes, as a substitute for alum gargles in affections of the throat, lozenges formed of alum, sugar, and tragacanth, mixed up with diluted laurel-water, so as to form lozenges, each containing a suitable dose of alum. The mass is to be well manipulated, and, after division, to be put on a sheet of paper and dried by a gentle heat. The lozenges keep well, and form an agreeable medicament, which, by aid of the saliva, becomes effectually applied to the parts. A pharmacien of Paris has for some time past prepared chlorate of potass in the same manner.—*Bull. de Thérap.*, tome lvii., p. 413.

The Influence of Cohabitation in the Transmission of Phthisis.—M. Bruchon concludes an interesting memoir upon this subject with the following propositions:—1. Pulmonary phthisis may become communicated in the course of time from individual to individual under the influence of cohabitation, and the consequent intimate relations—a proposition equally supported by reasoning, and by facts. 2. The transmission is usually operated from the older to the younger subject. 3. In the great majority of cases it takes place from the man to the woman. 4. It is to be feared in proportion as the subject exposed to it manifests a predisposition to the disease. 5. The influences which contribute to the result are identity of hygienic conditions, frequent absorption of morbid exhalations from the diseased subject, and fecundation by the latter.—*Revue Médicale*, 1859, tome ii. p. 88.

Application in Tumours of the Breast of a Doubtful Nature.—Benign tumours of the breast so far simulate cancer sometimes that even experienced surgeons advise their extirpation. M. Chahrelly has recently published several cases of this description in the *Bordeaux Journal de Médecine* in which a complete cure has been effected by applications of the following powder continued uninterruptedly during several months:—Powdered starch, 250 parts; powdered iodine, $\frac{1}{2}$ to 1 part; chlorhydrate of morphia, $\frac{1}{2}$ a part. Mix. The powder is to be applied upon a layer of wadding, which is to be kept *in situ* by a suspensory bandage.—*Bulletin de Thérap.* tome lvii. p. 412.

Injection of Tincture of Aloes in Gleet.—M. Gamberini, of Bologna, states that in some cases in which other injections have failed he has derived great advantage from injecting tincture of aloes 14 parts diluted with 120 parts of water.—*Ibid.* p. 426.

A Spanish Cure for Nymphomania.—A young woman of high position having terminated a brilliant education at a convent in Saragossa, was seized, after romance reading, with nymphomania. M. Ester, the physician, believing that acting upon the imagination of the patient was the only effectual mode of cure, had her suddenly and without explanation conveyed to the Venereal Hospital. She was there brought into the presence of a woman covered with syphilitic ulcers, and in the most deplorable state; and the sufferings, regrets, and

imprecations she listened to produced so vivid an impression upon the girl, that she at once returned to chaste ideas. She has since married, had children, and remained a model of grace and virtue.—*Ibid.* p. 429.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, NOVEMBER 21, 1859.

THE opening of the Medical Session here was inaugurated on Wednesday last with the usual pomp and ceremony, in the large amphitheatre of the "Ecole de Médecine," which was crowded to the door with students and others interested in the event. As is usual at this annual ceremony, an oration, was pronounced and prizes, in the shape of medals, were distributed to the "Laureats" of the past year. For one of the prizes (the Corvissart, I believe,) not one of the essays sent in for competition was considered of sufficient merit to entitle it to the reward, and the announcement of this fact was followed by a general murmur of disapprobation on the part of the students, which, however, was speedily suppressed by M. Gavarret humorously remarking that the fault did not lie with the Faculty, but with the students themselves. M. Wurtz, Professor of Chemistry, was the orator of the day, his subject being the "Memory of M. Soubeiran," one of two members of the Faculty who, since its meeting of last year, has paid the debt of Nature. As mention was merely made of M. Berard's death, it is to be presumed that his eulogy is reserved for some future occasion, for he was sufficiently distinguished to merit a few remarks. The discourse of M. Wurtz was comprehensive and pithy, and captivated in a more than ordinary degree the attention of his audience. The compliments he paid to the memory of his colleague were extremely graceful, and some of his remarks unusually happy and effective. Commencing with Soubeiran's boyhood, he rapidly traced his career through all its varied phases; remarked on the extraordinary difficulties with which he had struggled in his progress from comparative obscurity to the high and honourable position to which he had attained a few years before his death; and attributed his entire success to the untiring study and indomitable perseverance for which he was so remarkable. Of patronage he had none, but conquered every step by his own unaided efforts. In speaking of the discoveries he had made in pharmaceutical chemistry, the orator showed that Soubeiran's mind was essentially practical in its character, his investigations bearing specially, and, as if by preference, on the composition of those medicinal substances which are of acknowledged utility in the treatment of disease. To mercury, and its varied combinations, he had not only devoted great attention, but had, by his sagacity and perseverance, succeeded in imitating so well the English calomel, that the French no longer found themselves under the necessity of having recourse (as had been their wont) to the London market for this highly-important and invaluable preparation. With Liebig he shares the merit of having discovered chloroform: both these distinguished chemists having arrived at this important discovery about the same time, the researches of the one being quite unknown to the other. While according to Soubeiran's memory the praise which he so justly merited, I could not help thinking that M. Wurtz would have done well, when speaking of chloroform, to have made some slight mention of our distinguished countryman, Dr. Simpson, of Edinburgh, for certain it is, that this substance (though it may have been discovered by Soubeiran) was, as it were, a dead letter, a mere curiosity on the shelves of the laboratory—its utility having been utterly ignored—until Simpson proclaimed to the world its powerful and invaluable properties as an anæsthetic, and assigned to it the important place it now occupies in the domain of practical medicine. The subjects of prizes for the current year having been announced, M. Dubois, the Dean of the Faculty, declared the session opened, and the meeting ended.

At the Hôpital Lariboisière, M. Chassaignac is just now treating a case of club-foot, of the valgus kind, by the application of electricity, under the personal direction of M. Duchêne (de Boulogne), who has the merit of having introduced this novel method of treatment, and, so far as the case has gone, it is

likely to have a favourable termination; the foot, after but two or three Faradisations, having already become more natural in shape. It may be known to most of your readers that the action of the peronæus longus muscle is of a threefold kind; for example, it produces a rotatory movement of the foot, by which the plantar surface is turned outwards; it bends the foot, and it also turns the point of the foot outwards. In addition to these functions, M. Duchêne has discovered a fourth, and in this new capacity he regards it as a kind of active ligament of the plantar arch, which is developed by the contraction of this muscle. For this last-mentioned function, as well as for the three others, the peronæus longus lateralis has for its antagonist the tibialis anticus, the contraction of which produces straightening of the foot and flattening of the plantar arch. Proceeding on these views, M. Duchêne has succeeded in curing, without having recourse to section of the tendons, a case of valgus club-foot in which the arch was unusually high, or to use the French expression, a case of "valgus pied creux." It has also been successful after the section of the peroneus brevis and of the extensor longus, in completing a cure in a case of valgus where, after the operation, the foot on being placed in a proper position, was found to be perfectly flat (valgus pied plat). For the purpose of giving an arch to the foot, he directed currents of electricity to the peronæus longus lateralis, and the result was all that could be desired, without the use of any mechanical appliances. This latter patient, it may be well to add, was seventeen years of age; and models of the foot, in plaster of Paris, taken before and after the Faradisation, proved beyond doubt the efficacy of the treatment. The case at present under treatment at the Lariboisière Hospital, belongs to this latter category, and whatever the ultimate result may be, one thing I could not fail to remark, in common with some other professional men present, viz. that during the Faradisation of the peronæus longus muscle, there was a tendency to the development of the plantar arch; thus giving evidence of the existence of the fourth, or new function, attributed to this muscle by M. Duchêne.

Last week I saw M. Sichel, at his Clinique, perform extirpation of the left eye, in the case of a man some 30 years of age. The operation was deemed necessary in consequence of the existence of a tumour, situated at the inner and lower portion of the bony orbit, which during its development had completely destroyed the sight of the eye; pushing the globe forwards, upwards, and outwards. The tumour, on being examined *in situ*, presented the size of a large walnut, and could be pretty distinctly defined. It was of seven years' growth, and at one point fluctuation was perceptible. This latter circumstance, taken in connexion with the age of the patient, led M. Sichel to believe, or rather hope, that it might be a cyst; yet although the man was strong and vigorous, and apparently of a good constitution, the duration of the tumour, and more especially the slowness of its growth, rendered the diagnosis somewhat doubtful, and gave rise to a suspicion that it *might* be of a malignant character. The operation once decided on, it was carefully and ably performed, the tumour, together with the eye, having been removed *en masse*. M. Sichel, in the course of the dissection, finding rather suspicious evidence of the malignancy of the tumour, was particularly careful in removing every portion of tissue implicated in the morbid process. The hæmorrhage which followed the section of the optic nerve was not, in the first instance, great, and was easily controlled by the application of lint steeped in a solution of the perchloride of iron, but just as the dressing of the wound was about to take place, a violent attack of vomiting, the result no doubt of the chloroform, under the influence of which the patient had been kept for upwards of half-an-hour, brought on a recurrence of the bleeding, which for a few seconds threatened to be troublesome. It was, however, ultimately overcome by fresh applications of the same styptic, neither ligature nor actual cautery (which latter M. Sichel, by the way, loudly condemns under the circumstances) having been had recourse to. The patient has since progressed most favourably, and may now be considered convalescent, in so far, at least, as the operation is concerned. The tumour which, to the naked eye, had all the appearance of encephaloid disease, was forwarded to M. Robin, the famous microscopist, who pronounced it to be distinctly *encephaloid*, belonging to the variety styled "*melanique*," or melanotic.

In matters of this kind, M. Robin renders immense service

to the Profession throughout France. Pathological specimens of all kinds are daily forwarded to him, not only by the Medical men in Paris, but by those residing in the remotest parts of the empire; and his judgment as to their nature is in all cases considered law. While speaking of this highly talented and scientific man, I may mention that his house is now the resort of the greater part of the enlightened and intelligent Medical men of our own and other countries, who visit Paris. All are eager to secure a few hours' private instruction from him; and all those who have been fortunate enough to do so, agree in saying that M. Robin is a most invaluable, intelligent, and pains-taking instructor.

Another case of tetanus has occurred here in the service of M. Follin, at the Hôpital Necker, in which woorara was tried, but without success, as the sequel will show. The patient, a lad 16 years of age, had sustained a fracture of the lower third of the radius of the right arm, accompanied by considerable bruising of the soft parts. He was admitted on October 28, and up to the night of the 3rd of the present month everything went on satisfactorily. On the morning of the 4th, the masseter muscles were observed to be a little contracted, together with convulsive movements of the muscles of the face. These symptoms rapidly increased in gravity, and at 8 a.m., there was some difficulty in opening the jaws. Deglutition was also difficult; the respiration was abdominal, giving twenty-eight inspirations to the minute; pulse 116.

At half-past eight, a.m., ten drops of a solution of woorara (of the strength of one part of the drug to 100 of water) were injected by means of Pravaz's syringe into the cellular tissue of the forearm, the quality of the woorara having been previously tested by M. Vulpiau, who is esteemed an authority on this subject. Each drop introduced by the half turn of the syringe was esteemed by weight at three centigrammes. A fresh injection was made every half-hour, the doses being gradually increased, so that at half-past two, p.m., they had reached twenty-four drops. About half-past four a more concentrated solution was employed, but the number of drops was diminished. These injections, like the others, were continued every half-hour, the dose being gradually increased. Up to a quarter-past nine there appeared no change in the tetanic symptoms, with this exception, that the masseter muscles were perhaps not quite so hard.

At eleven, p.m., the jaws could be more easily separated, and a certain amelioration was perceptible. Injections into the cellular tissue of the chest were now had recourse to. The improvement did not continue; the disease, on the contrary, making such rapid progress that, after a more than usually violent paroxysm, he died at half-past one, p.m., the following day. In connexion with this case, M. Follin afterwards gathered from M. Cl. Bernard certain facts which may in part account for the non-success of the woorara, M. Bernard declaring that the action of this poison is infinitely less marked when administered to the mutilated and suffering animal than when given to the healthy and strong.

EDINBURGH UNIVERSITY COURT.—The Chancellor, Lord Brougham, has appointed Sir John Melville, late Lord Provost of the city, as his assessor, and the Rector, Mr. Gladstone, has chosen Dr. John Brown, the well-known author of "*Locke and Sydenham*." These appointments make the University Court, which consists of eight members, complete; and it is expected that a meeting will shortly be held to appoint three of the seven curators of the patronage taken from the Town-council, and of which body the Town-council have to elect four. The Curatorial Court must be constituted within two months from the 15th of October last.

PINEL writes thus to his brother, dissuading him from entering the Medical Profession:—"Paris is a remarkable place, where, without principles the most fixed, man may readily be seduced away from what is right; and where he is often utterly lost. You may, it is true, at length reach your desired object, but it is almost invariably by sinister means, which are repugnant to an honest mind. Moreover, amid an immense population, and the hurly burly of society every one thinks only of himself, without affection for others. Those who give you hopes of assistance do so only to assume the airs of protectors; and they forget you as you leave the threshold of their doors. . . . Trust me, your happiness is in your own hand in the place where Heaven has fixed you," etc.

GENERAL CORRESPONDENCE.

ON THE SO-CALLED "DIABETIC CATARACT."
LETTER FROM MR. WILDE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Permit me to offer a few observations on the paper by Mr. Haynes Walton in your issue for the 12th November, and that by Mr. France in the number for the 26th of that month. According to the latter authority it would seem that there was a special disease of the lens set up in patients labouring under diabetes. Without discussing this question, I have only to remark that the diagnostic symptoms described by Mr. France are to be seen in other cases totally unaffected by renal disease; and I have seen patients labouring under diabetes where cataract also existed of a totally different character, consistence, and course from that described by him.

With respect to Mr. Walton's method of extracting a soft lens by making a small incision with the ordinary knife, and then completing it with the small straight knife, or any other cutting instrument, so as to effect "an ample section along the upper margin of the cornea, without wounding the iris," it is not altogether new, though I am sure very applicable to the cases alluded to. A smallness of the anterior chamber, caused by the bulging forward of the iris, is observed, not only in many affections of the eye, but is often seen in a greater or less degree as the natural condition of the parts, and that, too, without producing any alteration in the adjusting powers of the eye. One hundred years ago anatomists did not believe that the iris presented a plane anteriorly, and it was upon this principle that O'Halloran invented his concave double-edged knife, to avoid cutting the iris. As I entered fully into this question many years ago, in my Memoir of Silvester O'Halloran, published in the *Dublin Quarterly Journal of Medical Science*, vol. vi., it is not here necessary further to allude to it. I have often had occasion to extract in cases where the iris projected towards the cornea, and have never had any accident therefrom. I remember one case, that of an old lady, the wife of the Registrar of Cork-street Fever Hospital,—where the iris was so much bulged forward that I had to make the point of the knife describe the segment of a circle in passing through the anterior chamber: the section turned out very well, and the vision was extremely good. It is, however, a manœuvre in operating one should not like to have to perform often, for reasons well known to those who frequently extract. What rendered the case more difficult was that the pupil could never be got to dilate to beyond somewhat less than the medium size. More than the usual amount of pressure had to be used, but there was no escape of the vitreous. I mention the address of this patient solely because the Medical officers of the Institution happened to be present at the time. Mr. Walton has reason to congratulate himself on the success of his cure; for certainly cataract operations in diabetic cases are by no means favourable.

I am, &c.

Dublin, Nov. 27, 1859.

W. R. WILDE.

THE *Bordeaux Journal of Medicine* tells us that in July last the heat was so great as to have exercised a very fatal influence—numerous cases of sudden death having occurred. Ten persons at least were conveyed in a dying state to the Hôpital St. André. Blood in these cases did not flow on venesection. Autopsies showed the existence of great cerebral congestions. Cholera infantilis also was very rife.

"THE Army Doctors suffer occasionally. They hear the balls whistling around them, and now and then get hit. At Solferino one of the first balls fired struck one of our comrades in the thigh, and the first wound he dressed was his own. Many of us ran great dangers, from the Head of the Medical Staff: many were wounded, but generally not seriously. But the Doctors' wounds are not always lucky ones. Besides those who have perished in Africa and in the Crimea, there exists in the archives of the Ministry a list of more than 7000 Military Surgeons grouped under the head of killed, died, or missing, during the wars of the Empire."—*Gaz. Méd.*

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL
SOCIETY.

TUESDAY, NOVEMBER 22, 1859.

F. C. SKEY, Esq., President, in the Chair.

A paper, by T. SPENCER WELLS, F.R.C.S., Surgeon to the Samaritan Hospital, Lecturer on Surgery at the Grosvenor-place School, was read, entitled,

THREE CASES OF TETANUS, IN WHICH WOORARA
WAS USED IN THE TREATMENT.

The author commenced by stating, that of upwards of 300 cases of ovariectomy recorded, he had only found one in which tetanic symptoms were observed; and referred to the singular fact that tetanus appeared in two out of four cases in which he had performed this operation last month, and to the equally remarkable circumstance that, although he had not seen a case of tetanus for upwards of ten years, a third case had occurred in his own practice within a month, and this after a very trifling operation, proving that the nature of the operation, or the mode of its performance, had little to do with the origin of the disease. The author alluded to recent cases of tetanus treated on the Continent by Vella, Manec, and Chassaignac; and to the experiments of Bernard with the alkaloid *curarina*, the active principle of the poison. He showed that the experiments of Sir B. Brodie in 1811, the application of the results of these experiments by Professor Sewell, at the Veterinary College, and subsequent experiments of Mr. Morgan, and of Dr. Harley, had anticipated all that had been done recently on the Continent, with the exception of making the actual trial on the human subject. The cases now brought forward were the first similar trials made in this country. The author then detailed the particulars of a case of chronic, but severe trismus, going on to opisthotonos, appearing a fortnight after ovariectomy in a patient 41 years of age. The exciting cause appeared to have been a draught of cold air. The great point of interest in the treatment was, that woorara was used hypodermically and epidermically, six grains of the extract having been used in six days. The patient recovered. In a second case, acute tetanus appeared seven days after ovariectomy in a lady, 38 years of age, and proved fatal in three days. The treatment was commenced by assafetida injections, and woorara was afterwards used, the softened extract having been inoculated in both arms. In the third case, tetanus appeared four days after a simplified perineal operation for the relief of prolapsus uteri in a patient, 51 years of age. It progressed slowly; was treated first by opium and ether, afterwards by woorara, and latterly by chloroform, the influence of which was kept up at intervals for forty-eight hours. The patient died on the evening the paper was read. The author, after expressing regret for the little positive information he had been able to lay before the Society as to the real value of woorara in the treatment of tetanus, thought that he had seen enough to establish the following propositions: 1. That our knowledge of the physiological action of woorara,—of its antagonistic effects to the artificial tetanus of strychnine,—of the results of its use in idiopathic tetanus of the horse and ass,—and the facts that two cases of chronic tetanus in man, on the Continent, and one in this country, have recovered during its application, should encourage further experiments. 2. That although three cases of acute traumatic tetanus in man on the Continent, and two in this country have died, notwithstanding the use of woorara, this should not discourage us from further trials, when we consider the very fatal nature of this form of tetanus, and the fact that in only one of these cases was the woorara applied in a large quantity. 3. That looking to the probable difference in strength of the specimens of extract brought to this country, and to the well-founded belief that they are not all prepared from the same species of vegetable, it would be well, in future trials, to use a solution of the active principle of woorara—the alkaloid *curarina*. 4. That it is desirable to ascertain as far as possible, by experiments on the lower animals, what dose of this

alkaloid might be inoculated with safety in man; and whether the artificial tetanus of strychnine establishes a tolerance of curarina. This would afford some test as to the safety of using much larger doses in man when suffering from tetanus than when in a state of health. 5. That Veterinary Surgeons should be requested to aid us in our attempts to determine the value of woorara when treating tetanus in the lower animals by carrying on the dose of the poison until its full effects were shown by suspended animation, and then restoring the animal by artificial respiration. In conclusion, he suggested that more accurate observation is much needed of what may be called the *Natural History of Tetanus*. "It has been demonstrated," he said, "that direct injury to nerves by pressure, contusion, puncture, or laceration, will induce tetanus. In many cases of tetanus important injuries to nerves have been discovered: such as a knot of whipthong embedded in the ulnar nerve, the knot of a ligature in the sciatic nerve, a splinter of wood in the radial nerve. In other cases, the nerves near a wound have been found reddened and tumefied, and evidences of inflammatory change have extended along nerves from the seat of injury to the spinal cord. But in many cases no change either in the peripheral nerves, or in the spinal cord or brain has been discovered. It is most interesting and important, therefore, to discover whether we may not have two very different conditions confounded under the single term, "tetanus;" whether in some cases we have spasms dependent upon irritation of a peripheral nerve and increased reflex excitability; and in other cases a blood disease caused by the absorption of a morbid animal poison, developed by perverted secretion of the wounded surface; which poison is analogous in its effects, and possibly in its composition, to urea, strychnine, and the poison of hydrophobia. Of the three cases I have brought before the Society, the two former strike me as instances of tetanus from morbid poison, and the third as dependent on injury to the branches of the perineal nerves. Much light may be thrown on this interesting question, by noting the effects produced on animals by inoculation of the secretions of the wound; or of the blood, or juice of muscle; or of the urine and other excretions of tetanic patients; and I trust that some of the gentlemen now present, may enrich Medical Science by some such observations as I have ventured to suggest."

Mr. CURLING said that no one who had witnessed the operation for ovariectomy, could be surprised at its occasionally giving rise to tetanus, but he believed that the circumstance of two cases in succession resulting after that operation was quite accidental. A similar occurrence took place at St. Mark's Hospital where there were very many operations for hæmorrhoids, tetanus never having followed them except in two cases which occurred in succession. He agreed with Mr. Wells in thinking that no satisfactory conclusion could be drawn from the two cases he had recorded, as to the beneficial influence of woorara. He remembered the early experiments to which reference had been made, and he had stated in his work on Tetanus, that the poison was deserving of a cautious trial in acute cases of tetanus in the human subject. Several cases had come under his care since that period, but the poison was not at hand for him to employ. One important objection to it was the difficulty of regulating its action. It was no doubt deserving of a further trial, but its application should be restricted to genuine cases of acute well-developed tetanus. He had seen many cases recover, not of an acute, but of a severe chronic form. In those cases chloroform had been very advantageous in warding off spasms for a considerable period. It would be a great advantage if a specimen of woorara could be obtained that might be depended on, and if a safe and efficacious mode of exhibiting it could be discovered.

Dr. HARLEY said he agreed with the author in believing that the conflicting opinions regarding the action of woorara on the human body, were chiefly due to the fact of the specimens employed being of ununiform strength. He had in his possession at the present time five specimens of the poison prepared by different tribes; and, although the general action of all was identical, yet their strength varied considerably. There was, however, a second, and equally important reason, namely, the mode of administration. Woorara differed from many remedies in not being absorbed equally readily when introduced into the body by various channels. Thus it could not enter through the un-abraded skin, and when taken by the mouth its action was extremely doubtful. Dr. Harley had made a pigeon swallow

twenty, and a mouse thirty, times more than was sufficient to destroy them if introduced by a wound, and yet both animals remained unaffected. This did not arise, he said, from the poisons being destroyed in the digestive canal, for he had seen Bernard poison a bird with the excrements of a dog, to which a poisonous dose had been given with impunity. As regards the value of woorara when compared to other narcotics, Dr. Harley remarked that he considered that its superiority consisted in its peculiar power of paralysing the motory, and not the sensory nerves. Nay more, he said, that it could be so administered as to destroy entirely the power of voluntary motion, without impairing the consciousness of the animal. (Dr. Harley related one or two experiments in proof of this statement.) In administering woorara to animals labouring under tetanus induced by strychnine, he therefore gave sufficient to paralyse all the muscles, except those of respiration. In this way he was able to allay the tetanic spasm without destroying the intelligence, or arresting the performance of the organic functions. And by continuing the thus moderated action of woorara until the kidneys had time to eliminate the strychnine from the system, he had been able to save the life of the animal. The theory of its action in tetanus was, Dr. Harley considered, much the same. That is to say, you try to keep the spasms from killing the patient by their violence, until the morbid state calling them into play has exhausted itself. The chances of curing by woorara a patient labouring under strychnine poisoning, are naturally much greater than those of curing a case of traumatic tetanus, where the morbid matter may go on increasing until its effects are more than sufficient to counteract the influence of woorara.

Dr. SIBSON said that in 1838 he wrote to Mr. Waterton on the subject of woorara. Mr. Waterton, after hearing of Mr. Sewell's experiments, went over to New Guinea to obtain a store of the poison, with a view to its use in cases of tetanus or hydrophobia. He afterwards experimented on an ass to show that an animal might be resuscitated, after what would otherwise be a fatal dose, by artificial respiration. He (Dr. Sibson) performed the experiments to try the effect of artificial respiration. For more than an hour the animal lay apparently dead, with no sign of life but the beating of the heart. At length it was made to breathe, and in an hour afterwards was walked round the room by Mr. Waterton. Some of the poison was given to him (Dr. Sibson), and he experimented with it upon a horse, the subject of tetanus. A dose proportionate to that given to the ass did not produce the desired effect; and in increasing it, the animal was destroyed. In another case the animal breathed at the end of three or four hours, but it died before the apparatus could be applied a second time. The animal was free from tetanus during the whole period of the experiment. He had performed experiments on lower animals similar to those described by Dr. Harley. In only one instance was any considerable result produced after giving the poison by the mouth, but in that case he considered that some abrasion had accidentally taken place. In order to overcome tetanus it was necessary to give an adequate dose, and he feared that an adequate dose would be such as absolutely to call for artificial respiration. He had been for years prepared to encounter the responsibility of employing artificial respiration in cases of hydrophobia; and in one instance, in which he was telegraphed for to go to Wakefield, he took his apparatus with him; but, when within thirty miles of the town he heard, greatly to his relief, that the patient was dead. He thought the woorara poison offered the best chance of success, from its complete destruction of the disease for at least a number of hours, and he hoped that in some case of hydrophobia it would be tried with artificial respiration. He feared that the symptoms of tetanus would be found too severe to be overcome without loss of life.

Mr. SPENCER WELLS said he should be sorry to see the poison administered in such quantities as to suspend animation, until more favourable results had been produced upon animals than those which followed the experiments of Mr. Sewell and Dr. Sibson. It was encouraging to observe that many of the improvements which were supposed to originate abroad should prove to have arisen in this country. A great stir had been made abroad as to the researches of Bernard and Vella respecting the physiological action of woorara and tetanus; yet years ago Sir B. Brodie, Mr. Sewell and Mr. Morgan were doing all that the French physiologists and Surgeons were now taking credit for. So with regard to the

distribution of the sensitive and motor branches of the mixed nerves, which Dr. Harley gave Bernard the credit of discovering by the aid of woorara—the same thing was pointed out twenty years ago by Mr. Hilton at Guy's Hospital.

Dr. RADCLIFFE said that in several cases tetanic spasms had given way to conium, which might be administered by the stomach, and was of very certain action. He suggested that this would be a better agent to employ than woorara.

The PRESIDENT said it was of the utmost importance that there should be a standard form of the poison obtainable by the Profession. If no such form could be obtained, the experiments would be valueless.

PASTEBOARD SPLINTS.

At the conclusion of the meeting, Mr. ACRON exhibited some pasteboard splints, which he had lately brought with him from the Continent. Mr. Acton stated he had seen these splints applied with great advantage in the Military Hospital at Brussels; and that their inventor M. Merchie, Chief Surgeon to that Institution, informed him that similar splints had been extensively employed by the Russians in the treatment of fractures at Sebastopol. They are exceedingly light, firm, and must be inexpensive, as they are manufactured in pasteboard or *papier-maché*. When wet the substance is moulded to the form of the thigh, leg, arm, or forearm. These portable dry splints retain the proper shape of the limb. In case of fracture occurring, half a splint is applied to the limb. A little cotton wool only intervening between the skin and the pasteboard. The other half splint is then placed on the opposite side of the fractured limb, and the whole enveloped in a bandage. The inventor had demonstrated on the field of battle, that as soon as these splints were applied, a man could be removed to the rear, and transported long distances without danger or pain in the usual conveyances. In country practice, Mr. Acton thought these ready-prepared splints would be of great service, particularly where it might be difficult to obtain additional professional assistance in putting up fractures; and in the forthcoming struggle with the Chinese they might afford considerable assistance to the Army Surgical Staff.

Several Hospital Surgeons augured well for the success of these splints, and were anxious to know where they could be obtained.

Mr. ACTON stated that his object in bringing them before the Society was merely to take the opinion of the members on their utility. None as yet had been made in London, but, doubtless, they could be manufactured at a very cheap rate.

OBITUARY.

PROFESSOR GEORGE WILSON.

A DEEP sense of regret and bereavement spread through Edinburgh last week with the melancholy news of the death of Dr. George Wilson, F.R.S.E., Professor of Technology in that University, which took place at a late hour on the 22nd ult. The loss of a man so learned and able in his own department, and so universally regarded with esteem and affection, is no common one to the city, or even to the country; and it is apparently heightened by the circumstance of his removal at a time when the prospects of his usefulness were greatly extending, as his talents and labours were being more fully appreciated. The Technology Class this winter was an unusually large one; and the Industrial Museum, in which Professor Wilson took so great and paternal an interest, seemed to have passed through all the initiatory difficulties, promising soon to take its place among the most prominent institutions of Edinburgh. Professor Wilson, whose health, at all times extremely delicate, had been further weakened by over-work, died of an inflammatory attack of about a fortnight's duration, though it did not assume a serious aspect till within a day or two of the end. From the address of the President of the Philosophical Institution, we extract the following feeling tribute to the departed Professor:—"A zealous and devoted student, eager in the pursuit of truth, indefatigable in research, versatile in application, he had at a comparatively early age earned a wide-spread scientific fame. Profoundly conscientious in the discharge of every duty, however arduous, his sincere, single-minded devotion to that department of science which he made peculiarly his own,

gained him the esteem and confidence of all, in every quarter of the country, with whom his pursuits brought him into contact. To him, in an especial manner, Scotland will owe not only her Industrial Museum, but the position which Industrial Science has already attained among us, as well as that wider future development, for which he has prepared the foundation, of those arts that enrich, fertilise, and adorn the material life of man. But his love for science was no exclusive passion; full of deep, gentle, and generous sympathies, he was warmly alive to the interests and wants of every class of his fellow-men—always willing and eager to aid in every effort for the promotion of their culture, their instruction, their material and spiritual welfare. We can all remember—alas, it is now only in memory that we can recall the pleasure—how often he has charmed as well as instructed us here; how often, in his prelections from this desk, the clear, scientific exposition has been enlivened and adorned by his graceful play of fancy. In many recurring sessions he has been one of the most admired and welcome lecturers of this institution; and on occasions too numerous to be recounted, we have thankfully profited by his advice—always ready, always judicious, always kindly and cheerfully bestowed. In his personal relations no one was more universally beloved—none will be more sincerely lamented." We learn from another source that "His last public lecture at the Pharmaceutical Society, on the Training of Young Students, was delivered with all his eloquence and zeal, and was full of the most genial and kindly feeling."

PROFESSOR LAWRIE.

It is with feelings which are but feebly expressed by the word regret that we announce the death of Dr. James A. Lawrie, Professor of Surgery in Glasgow University. The melancholy event occurred on Wednesday week, at the Bridge of Allan, where he had been residing for some time, in the hope that the purity of the atmosphere might alleviate the prolonged sufferings to which he was subjected. He had desisted for a considerable time from his professional duties owing to fast failing health, and though he resorted to change of air and a complete cessation from the cares of his office, he made no progress towards recovery. He was son of the Rev. Dr. Archibald Lawrie, of Loudoun (the friend of Burns), and, after undergoing the usual Medical curriculum, he proceeded to Madras Presidency, where he practised his Profession, and gathered the seeds of the disease which ultimately cut him off. Returning from India, he was appointed a Professor in the Andersonian University; and on the occurrence of the vacancy in the Professorship of Surgery in Glasgow University, caused by the melancholy demise of Dr. Burns in 1850, he was appointed to the Chair. He was an able and industrious preceptor, gentle and judicious as a practitioner, and highly esteemed as a member of society. He was the representative in the Medical Council of the Universities of Glasgow and St. Andrew's.

THE ROYAL SOCIETY.—The anniversary meeting of this Society was held on Wednesday at their apartments at Burlington-house. Sir B. Brodie, President, delivered his annual address. The medals were then awarded as follows:—The Copley Medal to M. Weber, of Göttingen, and the two Royal Medals to Mr. Arthur Cayley and Mr. George Benthams. The ballot for the election of the council and officers was then taken, and the following gentlemen were declared duly elected:—President: Sir Benjamin Collins Brodie, D.C.L. Treasurer: Major-General Edward Sabine, R.A., D.C.L. Secretaries: William Sharpey, M.D., and Mr. George Gabriel Stokes, M.A., D.C.L. Foreign Secretary: Mr. William Hallows Miller, M.A. Other Members of the Council: Mr. C. Cardale Babington, M.A.; Rear-Admiral Sir George Back, D.C.L.; Rev. John Barlow, M.A.; Mr. Thomas Bell; Mr. Arthur Cayley, William Farr, M.D., D.C.L.; Sir H. Holland, Bart., M.D., D.C.L.; Mr. Thomas Henry Huxley; Sir Roderick I. Murchison, M.A.; Mr. Thomas Webster, M.A.; Rev. William Whewell, D.D.; Alexander William Williamson, Ph.D.; Rev. Robert Willis, M.A.; Sir William Page Wood, D.C.L.; the Lord Wrottesley, M.A.; and Colonel Philip Yorke. After the election, the Society and their friends dined together at the Thatched-house Tavern, the President in the chair.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS.—At the Comitia Majora held on Monday, November 21st, Daniel Noble, M.D., Manchester, was admitted a Fellow of the College.

The following Members of the College were also admitted to the Fellowship, at the Comitia Majora, held on the 25th inst. :—

Alison, Somerville Scott, M.D., Park-street
Barclay, John, M.D., Leicester
Bardsley, Sir James Lomax, M.D., Manchester
Barnes, Robert, M.D., Finsbury-square
Beale, Lionel Smith, M.B., Grosvenor-street
Beattie, William, M.D., Upper Berkeley-street
Bird, James, M.D., Hyde-park-square
Bucknill, John Charles, M.D., Exeter
Cammack, Thomas, M.D., Spalding
Davies, John Birt, M.D., Birmingham
De Mussy, Henri Gueaneau, M.D., Cavendish-place
Dickinson, Joseph, M.D., Liverpool
Evanston, Richard Tonson, M.D., Torquay
Embleton, Dennis, M.D., Newcastle-upon-Tyne
Fleming, Alexander, M.D., Birmingham
Francis, Dayrell Joseph Thackwell, M.D., Northampton
Greenhow, Edward H., M.D., Berkeley-st., Portman-sq.
Haa, Charles John, M.D., Brooke-street
Hall, Charles Radclyffe, Torquay
Hoskins, Samuel Elliott, M.D., Guernsey
Hunt, Henry, Brook-street
Jackson, John, M.D., Hendon
MacLachlan, Daniel, M.D., Royal Hospital, Chelsea
Mapleton, Henry, M.D., Army Medical Department
Marcet, William, M.D., Chapel-street, Belgrave-square
Martin, Robert, M.D., St. Bartholomew's Hospital
Meryon, Edward, M.D., Clarges-street
Murchison, Charles, M.D., Wimpole-street
McWilliam, James Ormiston, C.B., M.D., Trinity-sq., Tower-hill
Odling, William, M.B., Prince's-place, Kennington-road
Olliffe, Sir Joseph Francis, M.D., Paris
Parker, Nicholas, M.D., Finsbury-square
Reynolds, John Russell, M.D., Grosvenor-street
Rolleston, George, M.B., Oxford
Sandwith, Humphrey, M.D., Hull
Shapter, Thomas, M.D., Exeter
Smith, William Tyler, M.D., Upper Grosvenor-street
Thurnam, John, M.D., Devizes
Vose, James Richard White, M.D., Liverpool
Weber, Hermann, M.D., Finsbury-square

ROYAL COLLEGE OF SURGEONS.—The following members of the College, having undergone the necessary examinations, were admitted to the Fellowship at a meeting of the Council held on November 24 :—

Andrew, Edwyn, University College Hospital
Croft, John, Dreadnought Hospital-ship
Hill, Matthew Berkeley, Stapleton, near Bristol
Marriott, Charles Hayes, Kibworth, Leicestershire
Painter, Richard Budd, Brydges-street, Covent-garden

At a meeting of the Court of Examiners held on Nov. 26, the following gentlemen were reported to have passed their Preliminary Examination for the Membership of the College in Anatomy and Physiology, and, when eligible, will be admitted to the Pass Examination :—

Atwood, William Alban, St. Bartholomew's Hospital
Bartlett, Thomas Hiron, Birmingham
Bale, William, Manchester
Bennett, Charles Henry, St. George's Hospital
Cheese, James, St. Bartholomew's Hospital
Evers, Charles, St. Bartholomew's Hospital
Fox, Allan Nesbitt, Dublin
Finch, Thomas, Birmingham
Foulds, Samuel, Leeds
Gayleard, Christopher, Guy's Hospital
Griffith, Gorrequer, Dublin
Gidney, John, Hull
Grosjean, James Keith Jeannert, St. Mary's Hospital
Hyde, George Edwin, Birmingham
Hutcheon, Henry Stone, Aberdeen
Heath, Robert Edward, Belfast
Hicks, Edward Buller, London Hospital
Johnson, James, Manchester
Johnson, Cuthbert Newington Hughes, Guy's Hospital
Kearney, Daniel, Madras
King, John Lynes, Guy's Hospital
Leachman, Albert Warren, University College
Levis, John Samson, Cork
Mackertich, Simon, King's College
Mawley, Augustus, University College
Miller, John Nicholas, University College
Monckton, Alfred, King's College
Morgan, Cosby William, St. Bartholomew's Hospital
Morgan, Theodore, St. Bartholomew's Hospital
Nathan, Henry Frederick, St. Bartholomew's Hospital
Neesom, Joseph, Leeds
O'Toole, William Henry, Dublin

Smith, William, Aberdeen
Somerville, James Harmer, Birmingham
Smith, Robert Harman, Guy's Hospital
Thomas, John Richard, Dublin
Von Lintzky, William Johnson, Calcutta

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 24th November :—

Adams, Samuel Hoppus, London
Beavan, James, Gravesend
Bower, Edmund, Weymouth
Bowling, Thomas, Birmingham
Empson, Charles Frederick, Selby, Yorkshire
Leniker, Elisha Harrie, Balderton, Newark-on-Trent
Lloyd, David, Carmarthen, South Wales
Neesom, Joseph, Bradford, Yorkshire
Nelson, William John, Acomb, Yorkshire

The following gentlemen also on the same day passed their First Examination :—

Cotton, Thomas, Spalding
Freeman, Delamark, Kennington
Hawes, Richard Metcalfe, Bedale, Yorkshire
Phillips, George Griffith, Newcastle Emllyn, South Wales
Sissons, William Harling, Hull

DEATHS.

BANKHEAD.—November 26th, at Florence, Charles Bankhead, M.D., formerly Physician Extraordinary to His Majesty King George the Fourth, aged 92.
BELLINGER.—November 14, George H. Bellringer, Assistant Surgeon H.M.S. *Gladiator*.
ELMHIRST.—November 18, at Ousslethwaite, near Barnsley, Yorkshire, Richard Elmhirst, of Lincoln, M.D., one of the Physicians to the Lincoln County Hospital for 28 years, aged 56.
HARRISON.—November 21, at Driffield, Washington Harrison, Surgeon, aged 59.
SANDFORD.—November 17th, at Wolverhampton, after a short illness, Richard Sandford, aged 40.
WEIR.—September 3, at Maryborough, Australia, John Weir, M.D., aged 30.
YOUNG.—November 22, at 3, Richmond-terrace, Belfast, George Henry Young, M.D.

THE child of Judge Hua, spoken of as stolen by Miss Chéreau, is a grandson of Richerand.

FIRE, by fault of Crinoline, is still one of Death's devouring agencies among the votaries of this amazing fashion.

COLONEL MURE has been elected Rector of St. Andrew's University.

DR. ROOKE has been elected an Alderman of Scarborough, after a severe contest.

THE ROYAL SEA-BATHING INFIRMARY AT MARGATE has held its half-yearly meeting, and announces a flourishing condition of its finances.

"DURING the Italian war chloroform was as extensively used, and was as harmless, as in the Crimea," says Surgeon-Major Armand; "I never heard of an accident from its use."

HOSPITALS OF THE AUSTRIAN MONARCHY.—The public civil Hospitals are said to amount to 330, and the military to 159 in number, 400,000 individuals being the mean number treated therein. There are also 40 Lunatic Asylums, containing about 6000 patients; 40 Maternités, at which 60,000 births per annum take place; and 33 Foundling Hospitals, receiving about 24,000 infants.

THE "DOCTEUR NOIR" SOLD UP.—The ventilation of the schemes of the impudent cancer-quack Vriès, or the "Docteur Noir," seems to have had the advantage of knocking up his trade; for the last we hear of him is an order for peremptory sale at the French "Tattersall's" of his carriage and horses, seized by his landlord for rent.

ANOTHER DEATH FROM CHLOROFORM AT PARIS.—A somewhat aged woman, possessed of a strong constitution, entered La Charité, under the care of M. Manec, on account of a dislocation of the shoulder. After the first attempts at reduction had failed, recourse was had to chloroform. The reduction was easily accomplished; but the Surgeon had hardly completed his manœuvres when the patient expired. All attempts at restoration were in vain.

CHOLERA IN MOROCCO.—The number of deaths from cholera in the French expeditionary army during the 20 days'

campaign against the frontier tribes of Morocco has been 2160. As the total of effectives has not been given, it is impossible to ascertain with certainty the rate of mortality, but if we suppose it to have been 10,000 men, the death-rate will have been 21·6 per cent. in less than a month.

ECCENTRIC BIRDS.—At the meeting of the Zoological Society, on the 22nd ult., Dr. Hamilton exhibited some specimens of young pheasants, in which several peculiarities were observed. These birds had the plumage of the cock bird upon the breast, and of the hen bird upon the back, and neither testes nor ovaries could be found on dissection. At the same meeting Mr. Bartlett stated that a Herring Gull (*Larus argentatus*), which was bred in the Society's Gardens, two years ago, was in the habit of passing the winter in the Gardens, and absenting itself during the summer months, as it was supposed for the purpose of breeding.

LONGEVITY AMONG THE PEERAGE.—It is not a little singular that of the score or so of Peers who have died since the commencement of the year there were 16 whose united ages amounted to no less than 1,229 years, giving an average of seventy-six and a half years each. The list of noble lords is as follows:—The Earl of Aylesford, aged 72; Lord Northwick, 81; the Earl of Ripon, 76; the Marquis of Bristol, 89; the Earl of Devon, 81; the Bishop of Bangor, 86; the Duke of Leeds, 60; the Earl of Moray, 63; the Earl of Tankerville, 83; Earl Cathcart, 76; the Earl of Harborough, 62; the Earl Minto, 76; Viscount St. Vincent, 92; the Earl of Jersey, 86; the Earl of Westmoreland, 75; and Earl Waldegrave, 71.—*Once a Week.*

CEYLON INSECTS.—Owing to the combination of heat, moisture, and vegetation, the myriads of insects in Ceylon are a far more important feature. There are "walking leaves" there which lay eggs like seeds, "walking sticks," which attain the length of several inches. Ants of all kinds and capacities swarm in overwhelming numbers, consuming everything which comes in their way, from the contents of your cupboards up to kyanized timber. They clear your portmanteaus, tunnel through your rows of books, and, as they never sleep, achieve extraordinary results in a single night. Ticks lie in wait for you in the jungle, and treat you as their natural burrowing ground.—*Tennent's Ceylon.*

THE SALAMANDER.—The menagerie at the Jardin des Plantes has just been enriched by the reception of a fine specimen of the *Salamanca maxima*, or large salamander of Japan. This reptile has been sent by M. de Codrika, French Consul General in the Dutch East Indian Colonies, as a present from M. Pompe van Meedervoot, Physician to the Dutch Government at Japan. Up to the present time there have been only two living specimens in Europe, one at Leyden and the other at Amsterdam. The salamander, which has only been known to Europeans since the tour of discovery made in Japan by M. de Siebold, lives in the mountain valleys of the Isle of Nippon, between the 34th and 36th degrees north latitude. It resides in the rivulets and lakes formed by the rains at a height of from 4000 to 5000 feet above the level of the sea. This reptile arrived in Paris from Batavia after a voyage of two months, and although it suffered a little during the passage, it appears now in excellent health. It is about twenty-seven and a half inches in length, and full grown will be about three feet.

IMPROVEMENT IN THE VOLTAIC PILE.—It is well known that Bunsen's pile, which is but a modification of Grove's, consists of a glazed vessel, containing a cylindrical element of zinc, which surrounds a porous vessel filled with strong nitric acid, into which a charcoal cylinder has been introduced, the liquid in the outermost vessel consisting of water acidulated with about 10 parts of sulphuric acid. Now, although this is a most powerful combination, and in general use, it has two great inconveniences; first, the quantity of nitrous vapour it evolves is highly unpleasant, and may become dangerous; and, secondly, the current produced is not of constant intensity. M. Thomas has just communicated to the Academy of Sciences a modification which he has effected in this kind of pile, and which would seem to be quite free from the inconvenience alluded to. M. Thomas, in fact, shows that the development of nitrous vapour is one of the chief causes which interfere with the constancy of the current, inasmuch as they attack the copper ribands forming the electrodes, and effect certain chemical combinations, which give rise to counter-currents, and thus impair the principal one. He

therefore causes these gases, as they are evolved, to pass into a porous vessel, where they are decomposed. In this process a secondary current is produced, which, by the peculiar construction of the apparatus, is turned to account, and tends to correct the inequalities of the principal current. This arrangement also prevents the pile from becoming dirty, as is the case with Bunsen's pile.

LIGHT appears to have an influence in the transformations of amylaceous matters, dextrine, etc. By its sole influence it so modifies amylaceous matters as to turn them into sugar and dextrine when they are exposed to the solar rays at a temperature of 100 cent. It also would appear that animal starch (glycogenous matter) is transformed into sugar more rapidly and more abundantly under the influence of light than in the dark. It is very remarkable that animal fecula remains in the liver of frogs without becoming starch during winter, just as the vegetable fecula ceases its transformations. In these animals, also, the greatest richness in sugar coincides with the period of the ripening of fruits. The glycogenous matter may remain unchanged in the liver, like starch in tubers and grains, if the frogs are entirely removed from the light; then no sugar is formed. In this way we may explain the rapid disappearance after birth of the glycogenous matter which exists so abundantly in the skin of the fœtus.—*Report by MM. Corvisart and St. Victor.*

BIRTHS, MARRIAGES, AND DEATHS IN PRUSSIA.—At the meeting of the Statistical Society on the 15th ult. Sir Francis H. Goldsmid, Q.C., read a paper "On some Recent Statistics of Prussia." While in London the children born out of wedlock are only 1 in 20, in Paris and Vienna every third child is illegitimate; and in Munich, years have even occurred when the number of illegitimate births have outnumbered the legitimate. In Prussia in 1816 the illegitimate births were to the legitimate as 8·05, in 1849 as 7·96 to 100. In Westphalia, however, in the province of Posen, and the Rhenish provinces, the proportion of illegitimate births is only about half as great as in the other parts of the kingdom. With regard to the proportion of births to the population in Prussia, Sir Francis stated, that from 1810 to 1825 the proportion was about 1 to 23, from 1828 to 1846 about 1 to 25 or 26, but that in 1849 it again reached 1 to 23. In the towns the proportion is 1 to 25·68, in the country as 1 to 22·88. In Berlin, in the year 1849, the proportion was 1 to 30·81. The death-rate, as compared with the births, was, in 1849, 498,862 as against 691,562; and while the excess of male births was 19,428, the excess of male deaths was 13,826. It was found that boys and young men died more quickly than girls and young women. Between the ages of twenty-five and thirty the deaths were equal in both sexes. From thirty to forty the excess was on the female side; after that, to sixty, it was on the male side again; so that among very old persons, it was found that more females died than males. The rate of mortality in Prussia, as compared with the population, varied between 1816 and 1849, from 1 in 28 to 1 in 37, the highest mortality having been in 1831, the cholera year.

DR. BARCLAY ON COMPULSORY VACCINATION.—Dr. Barclay, the Chelsea Medical Officer of Health, at a late meeting of the Vestry, stated that a letter had been received from the vestry of St. George-the-Martyr, requesting co-operation in bringing before Parliament the necessity for more stringent measures to carry into effect the Compulsory Vaccination Act. He (the Doctor) was of opinion that an answer in the affirmative should now be addressed to that Board, his reason for hesitation personally having been that a legislative enactment with that intent had been passed which had not been fairly tested. The provision having been repealed, the vestry seemed to be called upon to make some representation to the Government on the difficulties attendant on the attempt to carry out the provisions of the Act. But there seemed to him to be no good and sufficient reason why they should sit still until further legislation took place. The 132nd section of the Metropolis Local Management Act directed their Medical Officer of Health to point out the most efficacious mode of checking or preventing the spread of contagious epidemic diseases; and that could only be done with a view to the Vestry taking action for their prevention. He had had occasion to point out that small-pox had been on the increase lately throughout the metropolis, and was likely to assume an epidemic character. He regretted to say that many isolated cases had been recently reported to him in their district, and

therefore he felt it to be his duty to show the Vestry what ought to be at once done under the existing law and circumstances. In his former report he stated that the only available record of vaccination was exceedingly imperfect, and yet, such as it was, it must form the basis of their proceedings in this important question. He believed it was greatly through ignorance and interference that it was so, and therefore he should propose, in the first instance, merely to issue a notice to each person registering the birth of a child that if in due course the vaccination of that child was not also registered, further proceedings would be taken to insure the correct performance of the operation as required by the Act.

M. CHEVALLIER ON SMETHURST'S CASE.—M. Chevallier, the celebrated Paris expert, says:—"The perusal of the report of this case has given me cause for the most grave reflection, demonstrating, as it does, the excessive prudence which should always govern the expert in all matters confided to him by Courts of Justice, and the necessity there is of seeing and re-seeing before delivering his opinion. Entrusted now, during thirty years, with a great number of expertises, I have never employed Marsh's apparatus for the search of arsenic without feeling a beating at the heart. In fact, might not the life or the honour of a man or a family depend upon the reactions it manifested? What reflections must arise when we recollect that at a certain period the vinegar sold by C— contained arsenic, proceeding from wood-vinegar added to wine-vinegar?" We subjoin a few of the passages from the article "*Expert*," in M. Chevallier's *Dictionnaire des Falsifications*:—"The Chemist expert, who has obtained the confidence of the tribunals, when fully impressed with the importance of the mission entrusted to him, should, if his practice has been defective, engage in the special study of all the questions relating to juridical chemistry. He should never deliver his opinion unless his conviction is complete; and if he conceives any doubt, he should put away all false shame, and request that the opinion of another expert should be taken in conjunction with his own. We know of experts who, to avoid all error, have had performed in Paris the expertises they were charged to undertake in the provinces, and which they did not dare refuse for fear of being taxed with ignorance. An expertise is not, in fact, always an easy matter; and the functions of an expert exacts on the part of him who fulfils them profound knowledge joined to extreme prudence. I have been in a position to detect errors committed by persons possessed of considerable scientific acquirements, but who had not had sufficient practice. To become a skilful expert, it requires to have seen much and to have practised much."—*Journal de Chim. Méd.*

LEGAL OBSTACLES PLACED IN THE WAY OF MEDICAL MEN RECOVERING THEIR DEBTS.—Brompton County Court before J. L. Adolphus, Esq.: Ward v. Cooper.—This action afforded another instance of the obstacles placed in the way of the Medical Profession in getting disputed accounts settled in the County Courts; and so harassing have the proceedings of these law-courts of late become, as to cause many Medical creditors to give up just debts rather than wait all day in court, and be subject to the abuse of pettifogging advocates, and the injustice of the judges in cutting down their bills. In the present case the plaintiff, who formerly practised at Kensington, but is now residing at Wingfield, near Windsor, had to leave his patients, and travel to Brompton, to recover a bill of £7 19s. of a wealthy tradesman residing at Kensington, and who adopted the usual defence to Medical men's claims, "overcharge, and medicines charged for not supplied." Dr. Ward stated that in January of this year, five children belonging to the defendant were attacked with scarlet fever, and from that time, up to March, he paid the most unremitting attention to the patients. In the interim three of his patients died, and two recovered. He had no hesitation in rejecting an offer of the defendant to pay five pounds, firstly upon principle, and a duty he owed to the Profession at large; and, secondly, the charges were so moderate, under the circumstances, that if he made a deduction he should be a positive loser for drugs. The defendant said that part of the medicine supplied was charged for the three children after they had died, and he considered the bill a most unreasonable one, and that five pounds would be ample payment. Dr. Ward appeared astounded at the defendant's charge, and warmly contended that the medicine alluded to was not intended for the three dead children, but for the two that

survived. The defendant might as easily have urged that his attendances were for the deceased after they were buried: The Judge thought the defendant had so recently met with a calamity, that Dr. Ward should make some allowance, and directed a short adjournment, which ended in the plaintiff's positive refusal to come to any other arrangement than give two months' time to pay the bill. Ordinary costs were only allowed.

VITAL STATISTICS OF LONDON.

Week ending Saturday, November 26, 1859.

BIRTHS.

Births of Boys, 904; Girls, 881; Total, 1785.
Average of 10 corresponding weeks, 1849-53, 1547.8.

DEATHS.

	Males.	Females.	Total.
Deaths during the week	661	646	1307
Average of the ten years 1849-58	590.0	619.7	1209.7
Average corrected to increased population	1331
Deaths of people above 90
Deaths in 15 General Hospitals	41	21	62

DEATHS IN SUB-DISTRICTS FROM EPIDEMICS.

	Popula- tion, 1851.	Small pox.	Mea- sles.	Scar- latina.	Diph- theria.	Whoop- ing- Cough.	Dia- rrhoea.	Ty- phus.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.797 in.
Mean temperature	41.1
Highest point of thermometer	53.0
Lowest point of thermometer	28.8
Mean dew-point temperature	39.8
General direction of wind	S.E.
Whole amount of rain in the week	0.08
Amount of horizontal movement of air in the week	755 miles.

TO CORRESPONDENTS.

In the First Volume of the

Medical Times and Gazette

For 1860,

A SERIES OF PAPERS WILL APPEAR

BY DR. CONOLLY,

INTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE:

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,
SENILE INSANITY,
VARIETIES OF INSANITY WITH PARALYSIS,
UTERINE AND OVARIAN CASES,

With special relation to their Causes, as—

INTEMPERANCE,
UNSUITABLE STUDIES,
FANATICISM, ETC., ETC.

It is quite unnecessary to make a single remark upon the great interest of such a Series of Papers from so eminent a Physician, and so able a writer as Dr. CONOLLY.

Mr. Robertson's case shall appear next week.

Dr. Cregeen.—The conduct of the coroner in the case was most exemplary. Inquiry shall be made as to the legal liability of overseers in similar cases.

Rusticarius.—The days appointed for the examination of Licentiates in Midwifery may be learned by applying to Mr. Belfour, the Secretary of the College.

S. R.—1. Up to the age of 26. 2. We do not clearly understand the question; "the usual rate of mortality of Europeans by disease" is a very indefinite problem.

Dr. A.—Dr. Thom has published a Case of Rupture of the Uterus before Delivery, in the *Edinburgh Journal*. We never reprint articles from British contemporary journals.

Celsus.—It is only necessary to prove that anyone was in practice before 1815 to entitle him to register. It is clear that anyone so registered must be at least 65 years of age.

H. W. C.—Our solicitor has been instructed to proceed against the advertisers who fraudulently insert fictitious puffs of their filthy books, as pretended extracts from reviews in this Journal.

Querens.—It is entirely a matter of private arrangement or local custom; but as a general rule the accoucheur's fee includes any ordinary attendance on the mother until she is about again, though charges are made for medicines supplied.

Village Surgeon.—In the case mentioned, X should not have attended the child without previously conferring with P. The feelings of a patient must always be allowed their due weight in such cases, even by those who adhere to the strictest code of Medical etiquette.

THE EXPERIENCE OF A GUY'S DRESSER FOR THE WEEK. TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—It may be interesting to some of those who esteem the memory of the good old school wherein they acquired the first outlines of Medical science, to peruse the few accompanying notes by the dresser for the week commencing October 26th, and terminating November 2nd, showing that the privileges and advantages of this invaluable appointment which many have shared in bygone days, are still enjoyed by their successors.

The subjoined list comprises the accidents admitted during the week, and those treated in the Surgery, exclusive of the ordinary "taking in" day, when the beds were generally filled.

Accidents taken in the Hospital:—

- Fracture of Femur; Upper Third.
- " " Middle "
- " " Lower "
- " Tibia and Fibula; Middle
- " Fibula
- " Pelvis into Sacro-Iliac Joint
- " Neck of Humerus
- Comminuted Fracture of Humerus
- Injury to Spine and Pelvis (Contusion)
- " Leg
- " Abdomen
- Crushed Hand (Amputation)
- Compound Fracture of Finger (Amputation—3 cases)
- Local Gangrene from Direct Injury
- Tracheotomy for Foreign-body
- Severe Scald
- " Burn of Upper Extremity (2 cases)
- Retention (Permanent Stricture)

Accidents treated in the Surgery:—

- 6 Cases of Fractures of Clavicle
- Acromion Process of Scapula
- Coracoid Process
- Olecranon Process
- 3 Fractures of Ulna (alone)
- " Radius (alone)
- 3 Fractures of both Bones above Joint
- 6 Cases of Fractured Ribs
- " Spasmodic Stricture and Retention
- 4 Cases of old Permanent Stricture
- 2 " Palmar Abscess
- 4 " Thecal Abscess
- Gangrene of Tips of Fingers
- 6 Scalp-wounds
- 2 Cases of Necrosis of Metacarpus
- Dislocation of Thumb
- Lachrymal Abscess
- Wound of Palmar Arch (2 cases)
- " Temporal Artery
- Ventral Hernia
- Hydrocele (old)
- 3 Cases of Compound Fracture of Finger
- Phlegmonous Impaction over Patella
- 5 Cases of Morbus Londiniensis (2 for Stomach-purp, 3 Emetic, &c.)
- Contusions, Lacerated and incised Wounds, Sprains, Bites, and other Injuries of many Varieties

Many of these cases were subjects for admission, but would not submit to our recommendation. I am, &c. J. D. HILL, Dresser.

POOR-LAW MEDICAL REFORM ASSOCIATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your Journal of this day, under the head of "Correspondents," is an inquiry as to "the Constitution of the Poor-Law Medical Reform Association, and who are its Office-Bearers," by Mr. Paul Jones, a name, I presume, assumed for the occasion, as it is not in the Medical Register.

Usually, I refrain from replying to anonymous communications, for under such head Mr. Paul Jones must be classified; but in this instance I will break my rule, and inform the gentleman that I have the honour to be Chairman of the Association, conduct the correspondence, and act as Treasurer; and in the latter capacity shall be most happy to receive any contributions, as just now the funds are very low. There is also a Committee, which consists at the present time of thirty-four gentlemen, who reside in various parts of the Kingdom, and at distances so great from each other that it is impossible for them often to meet. They have, however, assembled in London seven times, and I have had frequent communication with them. During the agitation, upwards of 70,000 pamphlets and circulars have been distributed, and a very large number of petitions presented to Parliament.

As Mr. Paul Jones thinks that a "real and simple organisation would soon produce a well-considered and matured plan, acceptable to the Poor-Law Medical Officers, and reasonable and feasible too," perhaps he will have the kindness to make his plan public; and as I have already issued mine in the form of a draft Act of Parliament, the Poor-Law Medical Officers will be able to judge which they prefer. A variety of plans have at times been suggested; indeed, only last week, one gentleman wrote,—"All we want is our salaries increased one-third," not considering there are some Medical Officers with only twopence per case, whilst others have more than 120 times that amount, and therefore a lumping increase of one-third would afford but little satisfaction to the first-named, and would not be agreed to by the Guardians in the latter instance. Objectors are also numerous. One gentleman stated he would oppose the proposed Bill, unless I would consent to withdraw the clause which gives the private as well as the public vaccinator one shilling for each certificate of successful vaccination—the reason assigned is, that for the sake of the shilling the private vaccinator would vaccinate gratuitously.

From the above statements, Mr. Paul Jones must not be surprised if he find the office of a legislator not quite the sinecure he anticipates.

I am, &c., RICHARD GRIFFIN.

12, Royal-terrace, Weymouth, November 26, 1859.

COMMUNICATIONS have been received from:—

Professor SIMPSON; Dr. GORDON; Dr. SEATON; Dr. ADAMS; Dr. THOMPSON; Mr. STEDMAN; Dr. GRAILY HEWITT; REGISTRAR-GENERAL; Mr. WILDE, Dublin; Mr. GRIFFIN; Dr. HARLEY; Mr. SETON; Mr. RIVERS; Mr. WHEATLEY; Dr. BAINES; Dr. ESMARCH, Kiel; Mr. HUMPHREYS; Mr. RAYNER; Mr. ROBERTS; Mr. SERGEANT; Mr. SALE; Mr. WARD; Mr. BOLTON; Mr. MAY; Mr. WEBB; Mr. MORETON; Dr. SAUNDERS; Dr. LEINHART; Mr. ELLIOT.

APPOINTMENTS FOR THE WEEK.

December 3. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

5. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

EPIDEMIOLOGICAL SOCIETY, 8 p.m. Report of the Diphtheria Sub-Committee. By J. N. Radcliffe, Esq.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Dr. Cockle "On Certain Points of Diagnosis in Mitral Valve Disease."

6. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m.

7. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 1 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Lettsomian Lectures, by F. W. Pavy, M.D., Professor of Physiology at Guy's Hospital, "On Certain Points Connected with Diabetes." With Experimental Illustrations.

OBSTETRICAL SOCIETY OF LONDON, 8 p.m. (Council Meeting, 7 p.m.) Papers by Mr. Bailey, (Thetford); Drs. Barnes, Waller, Oldham, Priestley, Davis, Hodges; Mr. Ball, Mr. Baker Brown.

8. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

9. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

By Mr. Fergusson—Lithotomy; Removal of Growth from Upper Jaw.

Westminster Hospital.—The following operations will take place on Tuesday next, at 2 o'clock:—

By Mr. Holt—Amputation of Leg; Stricture of Urethra (3 cases); Necrosis of Tibia. By Mr. Brooke—Melanotic Tumour of the Eye.

W and A. Gilbey, Wine and Spirit

• IMPORTERS and DISTILLERS, are now doing by far the largest trade of any other house in the Kingdom, their connexion exceeding at the present time 15,000 private families and more than 50 of the most important Hospitals, Military Messes, and Public Institutions; they beg to offer the following advantages to consumers.

WINES FROM THE CAPE OF GOOD HOPE.

PORT, SHERRY, MADEIRA, MARSALA, all First Growths, 20s. per dozen, £3 6s. 6d. per 7-gallon cask, £6 11s. 3d. per 14-gallon cask, and £12 19s. per quarter-cask of 28 gallons.

They are pure, delicate, wholesome, and in every way suitable for either dinner or dessert.

The Custom House Returns for 1858 show that W. and A. G. paid duty on the unprecedented quantity of 56,635 gallons of these wines alone in that year.

WINES FROM PORTUGAL.

Fine Old PORT from the Wood 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

This, our leading article from Oporto is the old school of mature silky Port from the wood, with body and bouquet. This is more palatable and wholesome than those extremely high-priced Old Bottled Wines, which have nothing left to recommend them but vegetable decay.

WINES FROM SPAIN.

SHERRIES, Pale and Golden, at 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

The almost total disappearance of the Vine Disease in Spain, enables us to import an extremely good wine at this price; it is a decided improvement on former shipments.

WINES FROM FRANCE.

CLARETS at 24s. and 38s. per dozen. These, our leading importations of *Vin Ordinaire*, are superior to those generally drunk in France, and we guarantee them decidedly superior to any other offered at anything like these prices. They are shipped to us direct from the Vineyards, under the superintendence of one of the leading Bordeaux Houses.

CHAMPAGNE, 37s. 6d. per dozen. Having made a large contract to have this wine shipped direct from the vineyards, we are enabled to submit it not only as the cheapest imported, but as good as any gentleman can desire to have on his table.

WINES FROM SICILY.

MARSALA, 24s. per dozen, £4 0s. 6d. per 7-gallon cask, £7 19s. per 14-gallon cask, and £12 7s. 6d. per quarter cask of 22 gallons. This is Ingham's superior, and is often preferred to even middling-class Sherries, and the quality is guaranteed.

SPIRITS.

COGNAC BRANDY, finest	25s. per gallon.
GIN, the old English	11s. "
WHISKEY, Pure Old Irish	16s. "
.. Old Scotch	16s. "
RUM, Old Jamaica	14s. "

A dozen full-sized bottles of any of the above Wines at the quoted prices, or for 6s. in stamps a dozen small samples, or any two samples for 12 stamps, sent securely packed and labelled.

A detailed Price-List of other Wines, Spirits, and Liqueurs sent on application.

In England Cheques to be crossed to our Bankers, the Bank of England, and Post-office Orders made payable to the General Post-office, London; in Ireland the Bank of Ireland, and General Post-office, Dublin; in Scotland the Bank of Scotland, and General Post-office, Edinburgh.

W. and A. GILBEY, 357, Oxford-street, London; 31, Upper Sackville-street, Dublin; 12, St. Andrew's-square, Edinburgh.

South African Sherry, 19s. 6d. Port,

22s. Claret, 18s. Madeira, 24s. Amontillado, 26s. Cognac, 18s. 6d. Her Majesty's Wine Merchant. Specially appointed since May 1840. JAMES MARKWELL, Cellars, 35 to 40 & 45, Albemarle-street—Offices, 40, Albemarle and 4, Stafford Streets. Ports, from 30s.; Sherries, 30s.; Madeira, 42s.; Hocks, 40s.; Moselles, 41s.; Sparkling Hocks and Moselles, 48s.; Ditto, St. Peray, 54s.; Ditto, Burgundy, 60s.; Clarets, 28s.; Chablis, 38s.; Cote Rotie, 43s.; Champagne, 44s.; Sauterne, 40s.; Ditto, Yquem, 80s.; Essence of Turtle Punch, 56s.; Old Tom, 11s. 6d. All kinds of Foreign Spirits and Liqueurs. Particular and direct Shipments of Montilla, Vino di Pasto, Amontillado, Oloroso, Xres Viejo, Manzanilla, Longworth's Sparkling and Dry Catawba American Peach Brandy; Monongahela and Bourbon Whisky; and Sole Agent for the Celebrated Yankee Bitters. Bottled Stock for inspection, 6000 dozen. Cash or Reference. As usual, very liberal prices given for genuine Old Bottled Wines. Half-pints of first-class Champagne only.

N.B.—A considerable quantity of the Old Bottled Wines removed to Mr. M.'s Stock from Long's Hotel, North and South American Coffee House, Shugborough Park, and the celebrated Reading Sale.

IMPORTANT TO THE PROFESSION.

Glover and Company, Wholesale

DRUGGISTS, beg to call the attention of the Profession to their Price Current for pure Drugs and Chemicals and select Pharmaceutical Preparations.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting, of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.C.P.

"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.

"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Blancard's Pills of Unchangeable

IODIDE OF IRON,

Recommended by the Academy of Medicine of Paris, And authorised by the Medical Council of St. Petersburg, Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favourably noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 319.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

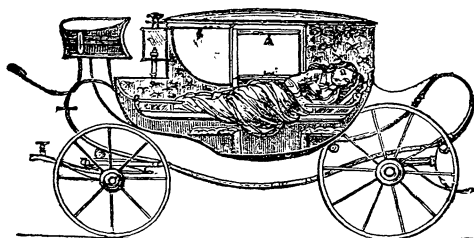

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40 Paris. General dépôt in England at M. Gabriel Jozéau's, French chemist 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

(a) Bulletin de l'Académie de Med 1850, page 1015; Gazette Médicale, Aug. 17, 1850; Union Médicale, Aug. 15 and 22, 1850; Gazette des Hôpitaux, March 15, 1853, and June 10, 1854; Gazette Hebdomadaire de Médecine et de Chirurgie, Aug. 31, 1855; Revue de Thérapeutique Médico-Chirurgicale, Feb. 15, 1855; Abeille Médicale, Revue Clinique; Répertoire de Chimie et de Pharmacie; Annuaire de Thérapeutique pour 1851, page 199; Orfila, Elements of Chemistry; Mialhe, Chemistry applied to Therapeutics, 1856, p. 319; Quevenne, Essay on the Physiological and Therapeutic Action of Preparations of Steel, page 97, 1854; Bricheateau, Treatise on Chronic Diseases seated in the Respiratory Organs; Soubeiran, Treatise on Pharmacy; Dorvault, Officine, &c. &c.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

IMPROVED INVALID COT CARRIAGES,

THE GREATEST LUXURY AND COMFORT EVER INTRODUCED FOR
REMOVING INVALIDS, BEING FITTED UP WITH THE
PATENT NOISELESS WHEELS.

These Carriages may be engaged, on moderate terms, for any journey, on application to

H. & J. READING,

COACHBUILDERS, 14, RIDING-HOUSE-STREET, CAVENDISH-SQUARE.

Also a good assortment of New and Second-hand Broughams and other Carriages for Sale or Hire.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, per-
vicious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

PELLATT & Co.,
FALCON GLASS WORKS, LONDON.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skull will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

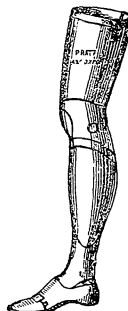

Anatomical Students are

invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS,

Surgical Instrument Maker to King's College Hospital, S, Portugal-street, Lincoln's-inn, W.C.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-

STREET, beg to call attention to the various improvements in

PATENT ELASTIC STOCKINGS BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c.—N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A Female to attend on Ladies.

Or SACCHARATED CAPSULES.—Copaiba and Cubobs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and has occasioned colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copphine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copphine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

Branch Practice.—A M.D. and L.S.A.

(Registered), aged forty, married, without any family, wishes for the Charge of a BRANCH PRACTICE, with or without a Union District. Address, Medicus, Post-office, Crewkerne, Somersetshire.

Medical Registration Office.

32, SOHO-SQUARE, W.

NOTICE.—In accordance with Sect. 27 of the Medical Act, no name can appear in the next printed and published copy of the MEDICAL REGISTER which does not appear in the General Register, as existing on the 1st day of January, 1860.

November 21, 1859.

Royal Westminster Ophthalmic Hospital, KING-WILLIAM STREET, CHARING-CROSS.

A COURSE of LECTURES will be delivered at this HOSPITAL, upon the Anatomy, Physiology, Surgery and Diseases of the EYE, in accordance with the Regulations of the Army and East India Boards, by HENRY HANCOCK, Esq., and HENRY POWER, Esq. The Use of the Ophthalmoscope, and the Microscopical Anatomy of the Eye, by JABEZ HOGG, Esq. To COMMENCE on 5th December, 1859, at 12.30. Fee for the Course, including Three Months' Hospital Practice, £5 5s.

Stockport Infirmary.—Wanted, an

ASSISTANT HOUSE-SURGEON and APOTHECARY. He must be a Member of one of the Royal Colleges of Surgeons, and a Licentiate of the Apothecaries' Hall. His duties will be to visit home patients and assist in the duties of the house. Engagement for two years, at a salary of £50 per annum, with Board and Apartments in the Infirmary. Testimonials to be sent prepaid to Mr. S. W. Wilkinson, Hon. Sec., at the Infirmary on or before the 3rd of December. The Election will take place on Monday, December 5th.

By Order of the Committee,
Stockport Infirmary, October, 1859.

S. W. WILKINSON, Hon. Sec.

Mental Disorders.—Wye House,

BUXTON, DERBYSHIRE.—PRIVATE ESTABLISHMENT for the Care and Treatment of a select and limited number of persons Mentally affected.

Resident Proprietor—T. DICKSON, L.R.S.C.E.,

Late Medical Superintendent of the Manchester Lunatic Hospital. Wye House is delightfully situated in its own grounds of twelve acres at Buxton, and forms part of the magnificent scenery of Wye Dale. The well-known salubrity of Buxton, and the hygienic effects of its waters and baths, renders it a desirable locality for Invalids Nervously or Mentally affected. Ample means are provided for the occupation and amusement of the Patients, including carriage and garden exercise.

Francis L. Puckridge, Sole Inventor

and Manufacturer of the late Mr. R. Liston's WATERPROOF TRANSPARENT ISINGLASS MEMBRANE PLASTER now patronised by Mr. Liston's successor, Mr. Quinn, in his hospital and private practice. Patronised likewise by Mr. W. Ferguson, Surgeon at King's College Hospital; Mr. P. M. Arnott, and Mr. Wormald, at Bartholomew's Hospital; used for amputations and other serious wounds requiring observation without exposure to air. F. L. P. begs to state there are two qualities, and it is particularly beneficial for spinal complaints, ruptures, sprains, burns, scalds, and any weakened part; also a defensive skin to apply between the wound and lint, and causes less pain in dressing; likewise a superior Waterproof Gauze Lisse and Linen, spread with the same adhesive properties as the membrane; also superior tinted Court Plasters, and Gold Beater's Skin by the yard, and in cases. F. L. P. offers his most grateful thanks for the encouragement and kind patronage he has received from the Medical gentlemen of England and foreign parts, and hopes to merit a continuance of their favours by manufacturing his Plasters with the same unremitting care as heretofore.

May be had of the Proprietor, 4, York-place, Walworth, Surgical Instrument Maker, Chemist, &c., with improved directions how to apply.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourgh and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

ESTABLISHED 1834.

Universal Life Assurance Society,

1, KING WILLIAM-STREET, E.C.

BRANCHES AT CALCUTTA, MADRAS, AND BOMBAY.

Empowered by Special Act of Parliament, 6 WILLIAM IV. c. 54. For the Assurance of Lives, at Home and Abroad, in the Civil, Military and Naval Services.

The Funds Invested and the Subscribed Capital exceed £1,180,000. Directors.

John Stewart, Esq., Chairman.

Charles Dashwood Bruce, Esq., Deputy-Chairman.

Augustus Bosanquet, Esq.

Ellis Watkin Cunliffe, Esq.

Herbert George Jones, Serjeant-at-Law.

William Kilburn, Esq.

John Farley Leith, Esq.

AUDITORS—Rt. Gardner, Esq.; Rt. Hichens, Esq.; H. W. Ripley, Esq.

BANKERS—The Bank of England, and Messrs. Currie and Co.

SOLICITORS—Messrs. Cotterill and Sons, and Messrs. Parke and Pollock.

PHYSICIAN—Geo. Burrows, M.D., F.R.S., 18, Cavendish-square.

SECRETARY—Michael Elijah Impey, Esq.

After the operations of a Quarter of a Century, the Directors invite, with great confidence, the attention of the Public to the marked success which has attended this Society, and to the strong claims it possesses to the confidence and support of all classes desirous of effecting Assurances on Lives. Combining the advantages of a Mutual and a Proprietary Company, and without attempting a rash competition with other Offices, it has pursued a steady, progressive course, affording all the benefits which, consistently with security to Assurers and Assured, can possibly be given.

The amount of the Society's Funds actually Invested exceeds £730,000. Upwards of £997,380 have been already paid in Claims and Bonuses, and the existing Policies amount to £2,214,928.

The Tables of Rates for Residents in Europe have been prepared upon the most approved principles to ensure moderation and security.

Assurances can be effected with or without a Participation of Profits; on ascending or descending scales; and for a limited number of payments.

The Society advance money on Mortgage; purchase Reversions and Life Interests; and grant Loans on such Securities and on Policies.

An Annual Division of One-fifth of the Profits is made, 75 per cent. of which is appropriated to Policy-holders, and 25 per cent. to the Shareholders; the remaining four-fifths are set apart towards the average of succeeding years. The Assurers can apply their Profits to the immediate Reduction of their Premiums, or as a Bonus to the sum assured.

All Medical Fees and Stamps are paid by the Society.

INDIAN BRANCH.

The Universal was the first Assurance Society that secured to Residents in India fixed rates and the advantages enjoyed by those in Great Britain. Separate Tables for the Civil and Military Services were originally framed with the utmost care from the Records of the India House, and valuable statistical returns accessible to this Society alone. To test their adaptation to the present time, and to ascertain whether any reduction could be safely made, they have recently undergone a minute and laborious investigation by two eminent London Actuaries, whose Report has established their soundness and accuracy.

Notwithstanding the extraordinary mortality occasioned by the late Mutiny, the Directors were enabled at the last Annual Division of Profits to announce a Reduction of Premiums on all Policies dated prior to 11th May, 1854, of £36 per cent.—a result attributable, in a great measure, to the correctness of the Rates and the judicious management of the Local Committees in India.

The attention of persons proceeding to India, and of residents there, is requested to a peculiar and most important advantage offered by this Society,—that on the return of Assurers to Europe the premiums on their Policies will be reduced to the English scale corresponding with the age when the Assurance was effected, without reference to the state of their health on their return.

Tables of Rates and all further information will be afforded at the Office in London, or by the Agents in India:—

Messrs. BRADDON and Co., Calcutta.

Messrs. BAINBRIDGE, BYARD, GAIR, and Co., Madras.

Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.

King William-street, E.C., June, 1, 1859.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, etc.) Also to his Liq. Taraxici, Liq. Galli Aparinis (a valuable alterative), Liq. Parietariæ (diuretic), and Liq. Belœ (prepared from the Ægle Marmelos, or Indian Bael), for dysentery and diarrhœa. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square.

BOUDAULT'S PEPSINE imported in original bottles. *Ed. Laricis Europ.***Those who cannot swallow Cod-Liver**

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—“The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered.”—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the “PULVIS JACOBI VER., NEWBERRY'S,”) 45, St. Paul's-Churchyard, London. ESTABLISHED A. D. 1746.

To Surgeons, Dentists, etc.—The Best

HOUSE in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard House, 78, Farringdon-street, City.

Established upwards of a Century.

A large Stock of New Instruments always on Sale, all Warranted. Instruments Bought, Sold, or Exchanged.

N.B.—The largest Stock of Second-hand Dissecting Cases in London.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Army Medical Department.—The next Competitive EXAMINATION for ASSISTANT-SURGEONCIES in the Army will take place on MONDAY the 9th January next. Applications to be made at once to the Director-General, Army Medical Department, No. 6, Whitehall-yard. There about thirty Vacancies.

November 28, 1859. T. ALEXANDER, Director-General.

India Office, 22nd November, 1859.

Notice is hereby given that the next Examination of Candidates for the Appointment of ASSISTANT-SURGEON in H.M.'s Indian Military Forces, will be held in this Office, on MONDAY the 12th of December, 1859, and succeeding days, and that the probable number of Vacancies to be then filled up, will be twenty-five.

Provincial Medical Practitioners wishing to increase their income, without derogating from their Professional standing, may address a line for particulars to W. H. 11, Mytton-street, Vine-grove, Manchester.

An elderly Country Practitioner in the West Riding of Yorkshire, is in immediate want of a Fully-Qualified and active ASSISTANT. One aged from 25 to 32 or 33 will be preferred. A good knowledge of Midwifery indispensable. Address, stating particulars, Mr. Wood, Cutler, Spurriergate, York.

Death Vacancy.—For Immediate DISPOSAL, in consequence of the sudden death of the late Practitioner. A successful Practice, of eighteen years' standing, in an extensive mining and manufacturing district in the West Riding of Yorkshire. Terms moderate. Full particulars on application. Address, Medicus, Herald Office, Dewsbury, Yorkshire.

Assistants Wanted.—Mair and Son will be glad to receive applications from Qualified Gentlemen who will accept Resident Engagements, at salaries of £50 per annum; and from Unqualified Gentlemen who will accept from £30 to £40 a-year.

PRACTICES.—MAIR and SON, having several eligible Practices for Disposal, are desirous to receive application from bona-fide purchasers.

Medical Agency Offices, 34, Bedford-street, Strand. W.C.

Nervous and Mental Disorders.—Wyke House, Sion Hill, Isleworth, Middlesex, W., a Private Establishment for the care and recovery of Ladies and Gentlemen mentally afflicted. Application to be made to Dr. R. GARDINER HILL, late Resident Proprietor of Eastgate House, Lincoln, 8, Hinde-street, Manchester-square, W., or to Dr. E. S. WILLETT, M.D., Wyke House, the Proprietors.

The Widow of a Medical Man, accustomed to the management of the Insane of both sexes (at home) for upwards of seven years, is desirous of meeting with a Lady or Gentleman, mentally afflicted, requiring experienced care and attention. References of the highest character can be given from Physicians of eminence. Address S. E. W., Post-office, Gloucester.

Preston Dispensary.—Wanted, a MEDICAL ASSISTANT to the HOUSE-SURGEON. He must be at least 21 years of age and unmarried. He will be provided with rooms, attendance, fire, and lights, and receive a salary of £45 a-year. His duties will be to Compound the Medicines, and to assist the House-Surgeon in the general business of the Dispensary. Applications to be made by letter to Mr. R. C. Brown, House-Surgeon. N.B. None need apply who cannot produce unexceptionable testimonials as to good moral character and diligence.

To Invalids.—A Married Medical MAN, without family, wishes to receive into his house, an Invalid Lady, who will have her own rooms and servant. The house, which is large, is healthily situated in a town within a short distance of London by rail, and the surrounding country is beautiful. References to Physicians, Clergymen, and others. For further particulars, address to A. B., 21, Harp-lane, London, E.C.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent, Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Stamford, Rutland, and General

INFIRMARY. The Governors will proceed to the ELECTION of a HOUSE SURGEON, APOTHECARY, and SECRETARY, at the TOWN-HALL, on TUESDAY, the 10th January, 1860, at One o'clock p.m. Candidates, who must be Members of the Royal College of Surgeons, and Licentiates of Apothecaries' Hall, are requested to send in Testimonials of Medical Education and Moral Character, addressed to the Chairman of the Weekly Board, on or before December the 27th, 1859. Salary, £100 per annum, with Board, Lodging, and Washing. The Secretary will furnish any information that may be required.

Board-room, November 29th, 1859.

Islington Dispensary. — Election of

PHYSICIANS.—A General Meeting of the Governors will be held at the Dispensary-house, Upper-street, on Tuesday, the 27th December instant, at eight o'clock p.m. precisely, to elect a Physician in the place of Dr. Burnie, resigned. Candidates must possess a Qualification from the Royal College of Physicians to practise Medicine in London, or at least must be eligible by Medical education to be examined for such qualification, and should they fail to obtain such qualification within twelve months after their appointment, their election to be void. Candidates must attend at the Dispensary-house, and exhibit their qualifications to the Medical Council on Thursday, December 22nd, at Seven o'clock p.m.

GEORGE LAMB, Honorary Secretary.

Death Vacancy.—Country Practice.

In consequence of the demise of a General Practitioner in a populous neighbourhood of the Midland District, an excellent opportunity offers for an energetic Medical Man to succeed to the Practice. There are several Club Appointments, and the whole connexion would be easily transferred. The successor would be expected to take the Drugs, Instruments, and Book Debts, at a fair valuation. A horse, and transfer of a house at option. The command of three-hundred pounds is requisite, and any gentleman treating immediately will find the terms extremely advantageous. Apply immediately, by letter, to M. R., Mr. Savage, Pelham-street, Nottingham.

South Staffordshire General Hospital.

A SPECIAL GENERAL BOARD of GOVERNORS of this Charity will be held on TUESDAY the 3rd day of January next, at ELEVEN o'clock precisely, for the purpose of ELECTING a SURGEON to fill the vacancy occasioned by the death of the late Richard Sandford Esq. Candidates, who must be Fellows or Members of the Royal College of Surgeons in London, Edinburgh, or Dublin, are requested to send in their Testimonials and Qualifications under cover to the Secretary, on or before Saturday the 24th day of December next.

By Order of the Weekly Board,

BENJAMIN SMITH, Secretary.

Wolverhampton, 29th November, 1859.

Medical.—Ledbury Poor-Law Union.

The office of MEDICAL OFFICER of the Yarkhill District of this Union, will be VACANT on the 25th day of December next. The Board of Guardians invite the application of Candidates who possess one of the four qualifications stipulated in the Poor-Law Commissioners' Consolidated Order of July 24th, 1847. The Medical Officer will be required to reside in the town of Ledbury, and conform in every respect to the Regulations of the Poor-Law Board. The District comprises Thirteen Parishes; area 20,925 acres; population 4587. Salary £100 per annum. The said salary to be inclusive of, and in consideration of, all extra fees, payable under the General Consolidated Order of the Poor-Law Commissioners. The Guardians will provide Medicines and Appliances: also, a competent person to dispense the same. The Election will take place at the Board-Room, Ledbury, on TUESDAY, the 13th day of December next, and the person appointed will hold the Office until he shall die, resign, or become legally disqualified to hold such office, or be removed by the Poor-Law Board. Testimonials to be sent to me, on or before the 12th day of December next. Candidates to be in attendance at the Board-Room, Ledbury, on the day of the Election.

By Order of the Board of Guardians,

Ledbury, Nov. 16th, 1859.

J. HUGHES, Clerk.

London: 11, New Burlington-street, W.

Just published, with Twenty-seven Engravings on wood, 8vo, cloth, price 5s. 6d.

Lectures on the Development of the GRAVID UTERUS. By WILLIAM O. PRIESTLEY, M.D., Fellow of the Royal College of Physicians, Edinburgh, Physician-Accoucheur to the St. Marylebone Infirmary.

John Churchill, New Burlington-street.

WORKS BY BERNARD E. BRODHURST, F.R.C.S.

The Treatment of Anchylosis; or, the Restoration of Motion in Stiff Joints. Second Edition, post 8vo, cloth, 2s. 6d.

LATERAL CURVATURE of the SPINE, its Pathology and Treatment. Illustrated by Engravings on Wood and on Stone. Post 8vo, cloth, 3s.

CLUB-FOOT, and ANALOGOUS DISTORTIONS Involving the Ankle-joint. Illustrated by Thirty-two Woodcuts. 8vo, cloth, 4s. 6d.

"The work before us is the latest on the subject of Orthopaedic Surgery, and is undoubtedly one of the best. It is the result of very large experience in this class of affections, is compiled with great care and judgment, and is enriched by a considerable number of excellent illustrations."—Medical Circular.

"The thinking Practitioner will find in Mr. Brodhurst's book many original observations which will well repay perusal; and many suggestions relative to the nature and treatment of congenital and non-congenital distortions, which no Practitioner should neglect to consult. We cordially congratulate the author on the successful achievement of an arduous labour, and the art of Orthopaedy on the addition to its literature of so honourable a production."—Lancet.

Also, nearly ready,

A MANUAL of ORTHOPÆDIC SURGERY.

John Churchill, New Burlington-street.

Ready next week, post 8vo, cloth, 3s. 6d.

On the Injurious Effects of Mercury in the TREATMENT of DISEASE. By S. O. HABERSHON, M.D.

London, Fellow of the Royal College of Physicians; Senior Assistant Physician and Lecturer on Materia Medica at Guy's Hospital.

A Manual of Operative Surgery on

the DEAD BODY: With Illustrations. By THOMAS SMITH,
 F.R.C.S., Demonstrator of Anatomy and Operative Surgery at St. Bartho-
 lomew's Hospital, and Surgeon to the Great Northern Hospital.

"The College of Surgeons having recently decided that a candidate for the surgical diploma should give some practical evidence of his operative skill, classes of operative surgery on the dead subject have been opened at most of our hospital schools. Hence such a hand-book as this of Mr. Thomas Smith became a necessity; and it has the advantage of appearing at a timely moment. . . . If we look for that which the author professes to have provided, — plain and intelligible directions to students for the systematic performance of operations on the dead body—a series of rules and explanations which every student of anatomy may usefully get by heart,—these we shall find. It is peculiarly a student's book. The cuts are good; the directions explicit; and the anatomy correct. . . . Mr. Smith has succeeded in producing a manual of considerable merit and utility to students, and one which will certainly meet with a very cordial reception at their hands."

Lancet, Dec. 3.

London: Longman, Green, Longman, and Roberts.

New Edition, just published, price 12s. 6d.

Hooper's Physicians' Vade-Mecum;

or, a Manual of the Principles and Practice of Physic. Sixth
 Edition, enlarged, improved, and carefully corrected to the present time.
 By Dr. GUY, of King's College.

This work is not only a complete Manual of the Practice of Physic, but
 the first part, written by the Editor, contains distinct chapters on the
 Causes of Disease and Death; the Physiology and Pathology of the Human
 Mind; the Symptoms and Signs of Disease; the Preservation of Health,
 including Naval and Military Hygiene, and General Therapeutics.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of

CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D.
 Senior Physician to the London Hospital, Founder of the Royal Orthopædic
 Hospital, &c.

- CONTENTS.
 1. Deformities in general. Treatment Operative, Instrumental, and
 Physiological. Forcible Extension under Chloroform.
 2. Contractions from Wounds and Diseases of Joints, Accidents, Rheuma-
 tism, &c.
 3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one
 Position.
 4. Deformities from Rickets, Weakness, and Curvatures of Bones.
 5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
 6. Congenital Malformations, Monstrosities.
 7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral
 Curvature, Spasm, and Paralysis.

Appendix: On Relapsed and Neglected Cases. Index.

"The best treatise on the subject in any language."—The Lancet, the
 British and Foreign Medico-Chirurgical Review, and the Philadelphia
 Medical Examiner.

On CLUB-FOOT and ANALOGOUS DISTORTIONS,
 including their Treatment both with and without Surgical Operation.
 8vo. Forty-one Engravings. 12s.

On ANCHYLOSIS or STIFF JOINT: a Practical
 Treatise on the Contractions and Deformities resulting from Diseases of
 the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London: Longman, Brown, Green, and Longmans.

DR. ALTHAUS ON MEDICAL GALVANISM.

Price 7s. 6d.

A Treatise on Medical Electricity,

THEORETICAL and PRACTICAL. By J. ALTHAUS, M.D.
 "Standard English work on Medical Electricity."—Medical Times.
 "Exhibiting the state of the science in its most advanced stages."—
 Medical Circular.

"The entire work is one that in these days of bookmaking, it is
 refreshing to meet with. It is evidently the production of a philosopher,
 and of one who studies his profession in the only way in which it ever
 should be studied, in a sound spirit of inductive philosophy. And we are
 but discharging our duty to our readers in most strongly recommending
 it to their notice."—Dublin Quarterly Journal of Medical Science.

Chlorodyne.—R. Freeman, Pharma-

centist, Kennington-road, London, S., informs the Profession and
 Trade that he has for years made, and extensively used in his business,
 Chlorodyne; and that he is supplying it in one-ounce stoppered bottles
 at 1s. 6d. each, four-ounce bottles at 5s. each. He guarantees it to be
 uniformly and properly prepared, and superior to any other makers',
 though their charge be ever so exorbitant; and he trusts that the low-
 ness of price at which he offers it will allow the Profession to use it in
 common practice and at public institutions, so that its extraordinary
 beneficial effects may be enjoyed by the poorest sufferer.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents intro-
 duced to the notice of the Profession at the Meetings of the Medical Society
 of London, and now extensively employed by the most eminent members
 of the Medical Profession. The Syrup is the most eligible mode of admi-
 nistering these valuable Remedial Agents. Mr. GREENISH will be happy
 to forward a variety of cases which have been furnished to him, where its
 success has been most marked, and which will serve to indicate where it
 may be most advantageously employed.—20, New-street, Dorset-square.

PURE SPIRITS FOR THE FACULTY.

This quotation admits of neither credit nor discount, and 1s. per
 gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Farnival's Distillery, Holborn.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy:—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations." **SAML. GRIFFITH, M.D. London, M.R.C.P.**
Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.
"Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

EDWD. BECK, M.D. Cantab.
Physician to the East Suffolk and Ipswich Hospital."

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

WILL. WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 333, Oxford-st.
MANCHESTER:—Mr. James Woolley.
LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.
YORK:—Messrs. Butterfield, Clarke and Co.
NORWICH:—Messrs. Smith and Sons.
PLYMOUTH:—Messrs. Balkwill and Co.
EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.
EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. DE JONGH, of the Hague.
"I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. DE JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—8, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

ADDITIONAL TESTIMONY ON THE EXTRAORDINARY EFFICACY OF DR. J. COLLIS BROWNE'S (M.R.C.S.L., Ex-ARMY MEDICAL STAFF) C H L O R O D Y N E.

MEDICAL PROPERTIES—Anodyne, Diaphoretic, Sedative, Astringent, Antispasmodic, Diuretic.

A few Extracts of Medical Reports are furnished in testimony of the exceeding value of this New Remedial Agent.

The following extract from a letter by Dr. SHORTHOUSE (late of the Metropolitan Convalescent Hospital), of Carshalton, to a Medical friend in the North of England, is published by permission:—

“And now, my friend, about ‘Chlorodyne’—the infallible and incomparable Chlorodyne! The best idea I can give you of my estimate of its value will be in the fact, that I have within the last fifteen months used 160 ounces of it, and, as each ounce contains about fifty adult doses, I have given at least 8000 doses. This is what I have administered myself, and is altogether independent of a large quantity which I have prescribed, and the patients have procured for themselves. It is, as I said before, a remedy quite *unique*, and its effects totally dissimilar to those of opium or any other English medicine. It requires some little management in its administration, so as to ensure its best effects. Out of the many hundreds of patients for whom I have prescribed it, I have found it disagree with but three.

“Its mode of action is that of an astringent in suppressing hæmorrhage and diarrhoea; an anti-spasmodic in colic and all forms of spasmodic cough; an anodyne in allaying pain and excitement, and producing tranquillity and a most heavenly state of repose.

“The cases (among others) in which I have employed it have been twelve cases of phthisis; eight of these patients had been examined by other Medical men, and had been regarded as genuine cases of consumption, so that the nature of the disease does not rest upon my testimony alone. They were all well-marked cases; for I do not mention several others in an incipient stage. Two of the cases were in the last stage—i. e. cavities had formed in the lungs; two others were bordering upon this stage. The remaining eight were in the second stage—that of softening; in five of these hæmoptysis was a prominent symptom. All these cases have done, or are doing, exceedingly well. Five of them have quite recovered; the others, with one exception, are in a fair way towards recovery.

“I have used it in many cases of whooping-cough and bronchitis, especially that form of the disease attended with laryngeal complication, i. e. irritation of the superior laryngeal nerve, with a very harassing spasmodic cough; and in these cases I can speak of it as a remedy of the highest value.

“In dysentery and dysenteric diarrhoea, and in mucous diarrhoea with pain round the umbilicus, it is invaluable; one dose, or at most two, being sufficient. In simple diarrhoea it is hardly worth while giving it a trial. But its effects are most marked in cases of hæmorrhage, which it will arrest almost instantaneously; I have had several proofs of this. In some forms of neuralgia it also affords relief in a very short period.

“I hope I have now said enough to induce you to give it a trial. But don't be misled; it is not a cure-all, nor did I ever ‘puff it off as a universal panacea for all ailments.’ It is what is perhaps better—a valuable therapeutic agent, with which you may successfully combat disease in many of its forms, and those forms most frequent and most formidable. In addition to its astringent and anodyne properties, it also possesses remarkable chemical ones, and has a marvellous effect upon the absorbent and nutritive functions. I have seen cases of secondary sores and indolent ulcers assume quite new features, when the ordinary remedies have been combined with small doses of Chlorodyne.”

From W. VESALIUS PETTIGREW, M.D., Hon. F.R.C.S. Eng.; formerly Lecturer upon Anatomy and Physiology at St. George's School of Medicine.

“I have no hesitation in stating, after a fair trial of Chlorodyne, that I have never met with any medicine so efficacious as an anti-spasmodic and sedative. I have used it in consumption, asthma, diarrhoea, and other diseases, and am most perfectly satisfied with the results.”

From the “MEDICAL TIMES.”

“TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

“SIR,—In reply to an inquiry made by your correspondent, who subscribes himself ‘Nota Bene,’ whether any cases of benefit from ‘Chlorodyne’ have come to the knowledge of your readers, I beg to say that I have been greatly pleased at the results in a case of severe pain in the hip-joint and in the vertebrae of the neck, which came on in a man long subject to chronic rheumatism, attended with permanent enlargement of the knees, ankles, and one of the wrists. He could not tolerate Opium, Hyoscyamus, or Belladonna, and in despair almost I gave him a prescription for a mixture of Chlorodyne in water, the dose being twelve minims. He took only two doses, which acted so well that he compared his feelings to being transported to Paradise. The effects lasted for several days. Whenever his pains return, he now takes a dose at bedtime, feeling secure of an escape for some days from suffering. I have also applied it locally, with good results, but in too few cases to report much upon it. It produces a certain amount of warmth and perspiration, with a remarkably soothing state of mind, as well as arresting the pain. No headache or other unpleasant symptoms followed its administration.

“I am, &c. “THOMAS A. HENDERSON, M.D., L.R.C.P.,

“Physician to the Ramsgate Infirmary.

“The Vale, Ramsgate, September 23, 1857.”

Extracts from the General Board of Health, London, as to its efficacy in Cholera.

“1st Stage, or Premonitory.—In this stage the remedy acts as a charm; one dose generally sufficient.

“2nd Stage, or that of Vomiting and Purging.—In this stage the remedy possesses great power, more than any other we are acquainted with, two or three doses being sufficient.

“3rd Stage or Collapse.—In all cases restoring the pulse. So strongly are we convinced of the immense value of this remedy, that we cannot too forcibly urge the necessity of adopting it in all cases.”

From THOMAS F. HALE, Esq., Surgeon, Saundersfoot, Pembrokeshire.

“SIR,—I should be much obliged by your forwarding three bottles of Dr. J. Collis Browne's Chlorodyne, which I have found most useful in allaying pain. I have used twelve ounces of it, and in nearly every case in which I have employed it, have every reason to be satisfied with the result; and although I object, as a rule, to use any preparation of a secret nature, and of whose composition I am not fully acquainted with, still, having once tried the Chlorodyne, and found that it really did produce the effects stated, I do not think I should be justified in withholding such a preparation from my patients when I see the value of the remedy.”

From C. V. RIDOUT, Esq., Surgeon, Egham, Surrey.

“SIR,—Having extensively used Dr. J. Collis Browne's Chlorodyne, I feel it incumbent upon me to add my testimony to the numerous evidences as you have already received of the undoubted efficacy of this remedy. As an astringent in severe diarrhoea, and an anti-spasmodic in colic, with cramps in the abdomen, the relief is instantaneous. As a sedative in neuralgia and tic douloureux, I can record a case where its effects were very remarkable. It occurred in January last. A gardener applied to me with pain in the head, resembling most distinctly tic douloureux as usually met with in the face; it was impossible for him to prevent his head moving from side to side with great regularity at intervals of five seconds. The

CAUTION.—Be sure to ask for Dr. J. COLLIS BROWNE'S CHLORODYNE; disappointment will result from any other.—See the Manuscript Signature.

Price 3s. per ounce, and in quantity of 10 ounces carriage free.

Sole Agent and Manufacturer—J. T. DAVENPORT, Operative and Pharmaceutical Chemist, 33, GREAT RUSSELL-STREET, BLOOMSBURY-SQUARE, LONDON.

pain and agony he described to be so acute that he was afraid it would induce madness. I prescribed ten minims of Chlorodyne every half-hour. The second dose mitigated his sufferings; and after the fourth dose he slept comfortably for some hours, and awoke refreshed and comparatively free from pain. I continued the Chlorodyne in diminished doses for a few days, since which time he has had no return of the attack. In uterine affections I have found it extremely valuable; and I could, if necessary, add many more striking instances of the powerful influence Chlorodyne exerts in controlling diseases.

From H. LEE HOGG, Esq., Surgeon, Tuddington.

“SIR,—I am much pleased with the action of Dr. J. Collis Browne's Chlorodyne. One day last week I was sent for in a hurry to visit a man suffering intense agony. I concluded he was passing a renal calculus, and I was correct. I at once gave him thirty minims of Chlorodyne, which caused almost immediate cessation from pain; and ten minims every four hours. The man passed a calculus as big as a small pea; and I have heard nothing more of him. I have also employed it in a case of severe after-pains with very satisfactory results; also in cases of asthma and bronchitis with marked benefit.”

From Dr. THOMAS SANDIFORD, Passage West, Cork.

“I will thank you to send me a further supply of Chlorodyne. It is the most efficacious remedy I ever used, affording relief in violent attacks of spasm within a minute after being taken. One patient in particular, who has suffered for years with periodical attacks of spasms of a most painful nature, and unable to obtain relief from other remedies, such as opium, &c., finds nothing so prompt and efficacious as Chlorodyne.”

From W. R. DAWES, Esq., Haddenham.

“DEAR SIR,—You should have heard from me sooner respecting the effects of Dr. J. Collis Browne's Chlorodyne, but the fact is, that I have found it so universally applicable as a sedative, that there is great difficulty in making a selection of cases which most strikingly mark its beneficial action without rendering my report inconveniently prolix. I can, however, most truly say, that it is a remedy more generally efficient than any other with which I am acquainted. Its sedative and anodyne effects are not only more speedily produced, but they are also more lasting, and are not followed by exhaustion, or headache, or disturbance of the digestive functions; on the contrary, in many instances its continued use has been followed by exhilaration of spirits and improvement of appetite, especially in the various painful symptoms attending uterine irritation. In hysteria and in dysmenorrhœa, this remedy acts like a charm, as also in nervous headaches and in many cases of cough. In fevers, combined in the early stage with tartarised antimony, it is often of signal service; nor is an increase of dose usually requisite to maintain its beneficial action. In a case of phthisis, the moderate dose of ten minims, taken every night, has sufficed for many months to secure quiet rest, scarcely disturbed by cough, while the omission of it is invariably followed by a restless and coughing night. One fact strikes me as very remarkable—namely, that while the tendency of Chlorodyne to produce constipation is so slight as rarely to require an aperient, it has never failed speedily to stop diarrhoea, or to extinguish attacks of ordinary Cholera. In only two or three instances has it disagreed. The sleep which follows the composing influence of the medicine is peculiarly light and refreshing.”

From Dr. B. J. BOULTON and Co., Horncastle—Sept. 26.

“We have made pretty extensive use of Chlorodyne in our practice lately, and look upon it as an excellent, direct sedative and anti-spasmodic. It seems to allay pain and irritation in whatever organ and from whatever cause.

“It induces a feeling of comfort and quietude not obtainable by any other remedy, and it seems to possess this great advantage over all other sedatives, that it leaves no unpleasant after-effects.”

ORIGINAL COMMUNICATIONS.

REVIEW OF CASES OF STONE IN THE BLADDER.

By THOMAS P. TEALE, F.R.C.S.
Surgeon to the Leeds General Infirmary.

THE Statistics of Lithotomy lately published in the *Medical Times and Gazette*, have led me to review my own practice as regards the treatment of Stone in the Bladder, with the object of ascertaining its results, and of noticing the changes which from time to time have been made in my mode of operating.

If such a review were generally made by Surgeons, and its results recorded, embracing all the cases treated by each, much valuable information would be acquired. Influenced by this conviction, I proceed to submit to the Profession all the cases of Stone in the Bladder which have been treated in my own practice, public or private, ranging from the year 1826 to 1859.

These operations are 87 in number, and may be classed under the following heads:—

	Cases.	Recoveries.	Deaths.
1. Lateral Lithotomy in Adults	35	22	13
2. Lateral Lithotomy in Children	18	18	0
3. Lithotripsy in adult Males	15	14	1
4. Median Lithotomy	12	11	1
5. Stone in the Female	7	7	0
	87	72	15

Of these cases, an unusually large proportion were adult males, namely, 57 in 87, the remaining 30 consisting of 23 male children and 7 females of various ages.

The cases to which initials only are attached occurred in my private practice. Those of which the names are given in full were treated by me in the Leeds Infirmary.

TABLE I.—LATERAL LITHOTOMY IN THE ADULT.

No.	Date.	Name.	Age.	Result.	Remarks.
1	March 11, 1826	Mr. H.	66	Death	Death on sixth day from inflammation of cellular tissue of the pelvis; a very fat subject; prostate much enlarged; lithic calculus, 2 ounces
2	July 9, 1835	Mr. B.	30	Recovery	Phosphatic stone, 4 drms.
3	Sept. 6, 1838	Francis Marston	67	Recovery	
4	Aug. 9, 1841	Mr. W. M.	66	Recovery	After apparent cure of lithic acid stone by lithotripsy, return of symptoms of stone with great irritability of bladder, rendering lithotomy necessary, by which several phosphatic concretions were removed.
5	Jan. 1, 1842	Wm. Dixon	40	Death	Lithic acid, 3½ ounces; typhoid symptoms; death on 21st day.
6	April 1, 1843	George Longley	19	Recovery	Mulberry, 5 drachms.
7	May 13, 1843	Mr. B.	76	Recovery	Nine lithic acid calculi.
8	Feb. 22, 1844	Mr. G. C.	63	Recovery	Two lithic acid calculi, weighing 9 drachms and 2 drachms respectively.
9	June 19, 1844	Benj. Johnson	62	Recovery	Lithic acid calculus, 1 ounce 2 drachms.
10	July 5, 1844	Chas. Hammond	21	Recovery	Albuminuria; brisk hæmorrhage twenty-two hours after operation, and again on the 7th day; lithic acid, 7 drachms.
11	Aug. 30, 1845	Joshua Gledhill	60	Recovery	Albuminuria; slow recovery; small fistula remaining several months; lithic stone, 7 drachms.
12	Oct. 22, 1846	Mr. W. W.	69	Recovery	Lithic acid, 3½ ounces.
13	Oct. 31, 1846	Wm. Doughty	68	Recovery	He had subsequently a return of stone, but was not again operated on; lithic acid, 3 drachms.

VOL. XL. No. 1054.—NEW SERIES, No. 493.

No.	Date.	Name.	Age.	Result.	Remarks.
14	Sept. 6, 1847	John Wright	63	Death	Died on the 10th day of bronchitis; no mischief in the pelvis detected after death.
15	Jan. 15, 1848	John Adamson	58	Death	Died exhausted on the 15th day; no morbid appearances observed after death; mulberry, 5 drachms.
16	June 29, 1848	James Clay	41	Recovery	Lithic acid, encrusted with triple phosphate, 6 drachms.
17	Sept. 21, 1848	Edwd. Gomersal	30	Recovery	Lithate of ammonia, 5 drachms.
18	Aug. 1849	Mr. C.	58	Death	Eight calculi; he did well for three or four days, had a rigor and died on the 6th day. No examination after death.
19	Aug. 20, 1849	Mr. L.	64	Recovery	Lithic acid, 7 drachms.
20	Jan. 17, 1850	J. T. Peel	14	Recovery	Mulberry, 6 drachms.
21	Sept. 28, 1850	Mr. B.	58	Death	Ten calculi; at the end of three weeks he was considered nearly convalescent, when he was seized with pelvic and crural phlebitis, and died on the 24th day.
22	Jan. 4, 1851	Mr. S. W.	53	Recovery	Mulberry, 5 drachms.
23	Jan. 23, 1851	Henry Wright	16	Recovery	Lithic acid, 2 drachms.
24	Oct. 30, 1851	John Stead	22	Recovery	Lithic acid, 2 ounces.
25	Oct. 30, 1851	Thomas Overend	53	Death	Lithic acid, 2 ounces and 1 drachm; death in six weeks; calculi in kidneys and suppurated of kidneys.
26	Dec. 18, 1851	John Harrison	63	Death	Died on the 4th day from strangulated intussusception of the jejunum; lithic acid 1½ ounces.
27	Dec. 18, 1851	Wm. Herring	35	Death	Died on the 17th day from repeated hæmorrhages into the bladder; small phosphatic stone.
28	April 15, 1852	Mr. W. S.	41	Death	He was a constant sufferer from gout; proceeded without a bad symptom until the 12th day, when he was considered convalescent. He was then seized with affection of the brain, and died comatose on the 17th day. After death the wound was found healed, and the pelvic organs free from disease.
29	Oct. 28, 1852	Chas. Eastwood	19	Death	Urine of specific gravity 1005, but not albuminous; death on 3rd day; slight effusion of lymph in peritoneum; mulberry, 1 ounce 5 drms.
30	Feb. 11, 1854	Mr. C.	74	Recovery	Two lithic calculi of moderate size.
31	April 26, 1855	Chas. Shepherd	14	Recovery	Encrusted stone; oxalate of lime, with a thick deposit of phosphates on the exposed parts; 9 drachms.
32	April 18, 1856	Mr. D. B.	72	Death	An intemperate, paralytic, and purpuric subject; the operation was undertaken at his urgent request, on account of his extreme suffering; he died exhausted on the 3rd day; two lithic calculi, weighing 2½ and 2½ ounces.
33	Nov. 4, 1856	Mr. J. B.	70	Recovery	
34	Jan. 15, 1857	Jos. Lockwood	22	Death	Lithic acid 4½ ounces; severe hæmorrhage followed the operation; death on 8th day; diffuse suppurated about the rectum, and slight general peritonitis.
35	May 21, 1857	A. Bosomworth	20	Recovery	Mixed phosphatics; he was cut for stone when 2½ years old.

From these tables it appears that lateral lithotomy was performed eighteen times on subjects under the age of puberty without a single death; and that seven cases of stone in the female were treated without a fatal result. We may, then, conclude, as had already been done on a much larger scale, that lateral lithotomy in children, and the various operations

for the removal of stone from the female bladder, may be performed with a generally favourable result.

It is, however, in considering the treatment of stone in the adult male, that the question of the fatality of the operation demands our serious thought. To this part of the subject, therefore, my observations will be chiefly directed.

STONE IN THE ADULT MALE.

On referring to Tables 1, 3, and 4, it will be seen that 57

TABLE 2.—LATERAL LITHOTOMY IN CHILDREN.

No.	Date.	Name.	Age.	Result.	Remarks.
1	Nov. 15, 1834	James Young	12	Recovery	Phosphatic stone, 5 drms.
2	Aug. 27, 1835	Robert Fryer	3	Recovery	
3	Dec. 17, 1836	Jno. Clutterbuck	11	Recovery	Lithic acid, 1 ounce.
4	Jan. 28, 1841	Master Y.	4	Recovery	Cystic oxide stone, about the size of a filbert; return of symptoms of stone; lithotomy repeated in the following September, when a stone of crystallised triple phosphate was removed; he died three years afterwards of acute inflammation of pleura and pericardium connected with renal disease.
5	July 15, 1841	George Naylor	4	Recovery	Lithic acid and triple phosphate, 3 drachms.
6	Sept. 10, 1841	Master Y.	5	Recovery	Crystallised triple phosphate, 1 drachm.
7	Aug. 24, 1845	Wm. Garfitt	13	Recovery	Lithic acid, 5 drachms.
8	Aug. 30, 1845	Jesse Fowler	4½	Recovery	Lithic acid and phosphates, 5 drachms.
9	Oct. 22, 1847	George Lund	7	Recovery	Phosphatic stone, 1½ drachms.
10	Nov. 9, 1850	Wm. Hindle	3½	Recovery	Phosphates, 2 drachms.
11	Dec. 11, 1852	Geo. Goodyear	8	Recovery	Lithic acid, 5½ drachms.
12	Aug. 2, 1854	John Maclean	3	Recovery	Small oxalate of lime.
13	April 26, 1855	Simon Wilson	7	Recovery	Lithic acid and phosphates, 2 drachms.
14	April 17, 1856	Thomas Fisher	9	Recovery	Two lithic calculi, ½ ounce and 3 drachms.
15	April 17, 1856	Wm. Ford	2½	Recovery	Lithic acid, 1 drachm.
16	July 12, 1856	Josh. Jopson	7	Recovery	Lithic acid, six drachms.
17	May 7, 1857	John Fagan	4	Recovery	Lithic calculus coated with triple phosphate; 2½ drachms.
18	Dec. 2, 1858	Saml. Gomersal	4	Recovery	Lithic acid, ½ drachm.

TABLE 3.—LITHOTRITY IN ADULT MALES.

No.	Date.	Name.	Age.	Result.	Remarks.
1	Dec. 1836	John Nuttall	56	Recovery	Five operations.
2	June, 1839	Geo. Rushworth	30	Recovery	Three operations.
3	Oct., 1840	Wm. Harwood	68	Recovery	Six operations.
4	June, 1850	Wm. Smith	24	Recovery	Two operations.
5	Nov., 1850	Mr. H.	30	Recovery	Two operations.
6	Dec., 1851	Wm. Myers	49	Recovery	
7	Aug., 1852	Edmund Brooke	59	Recovery	Large lithic stone, indicating 1½ inch by the grasp of the instrument; six operations.
8	Jan., 1853	George Swaine	24	Death	Phosphatic stone; three operations, from Jan. 6 to Jan. 27; death Feb. 10; cyst in bladder and in prostate; ulceration and hypertrophy of right kidney; pyelitis of left.
9	Jan. 7, 1853	Mr. M. A.	75	Recovery	Several calculi about the size of hazel-nuts; twenty-two operations, without any serious symptoms.
10	Jan., 1853	Mr. Q.	38	Recovery	Five operations.
11	Nov., 1853	Edmund Brooke	60	Recovery	He was relieved by lithotritry in August, 1852; has lately had return of symptoms of stone; five operations; the fragments consisted of triple phosphate, and of lithic acid.
12	Feb., 1854	Mr. H.	45	Recovery	Four operations.
13	Aug., 1854	Mr. H. H.	60	Recovery	Seven operations.
14	Feb., 1857	Mr. F.	55	Recovery	Six operations.
15	Dec., 1858	Mr. J.	55	Recovery	Five operations.

operations were performed on males of adult age, or who had reached the period of puberty, with the following results:—

Cases.	Recoveries.	Deaths.	Death.	Cases.
35 Lateral Lithotomy.	22	13	or 1 in 2½	
15 Lithotritry.	14	1	or 1 in 15	
7 Median Lithotomy.	6	1	or 1 in 7	

TABLE 4.—MEDIAN LITHOTOMY.

No.	Date.	Name.	Age.	Result.	Remarks.
1	Sept. 12, 1857	Josh. Wilman	61	Recovery	Small phosphatic stone.
2	Oct. 1, 1857	Wm. Redman	66	Recovery	Two lithic stones adapted to each other by a flat surface on each, and extracted as one stone. These conjointly weighed 1½ ounces, and measured 4½ inches in smallest circumference.
3	Nov. 9, 1857	Jon. Martin	5	Recovery	Lithic acid, 1 drachm and 24 grains.
4	Nov. 28, 1857	John Ward	8	Recovery	Oxalate of lime, 1 drachm and 24 grains.
5	July 29, 1858	Henry Cooke	25	Recovery	Oxalate of lime, 5 drachms.
6	July 29, 1858	Josh. Wilman	62	Recovery	Phosphatic stone, 2 drms.
7	Aug. 31, 1858	Henry Green	12	Recovery	Oxalate of lime, 7 drms.
8	Jan. 13, 1859	Wm. Lawrence	40	Recovery	Lithic acid, 6½ drachms.
9	Jan. 27, 1859	Josh. Wilman	62	Recovery	Small phosphatic stone.
10	March 5, 1859	Thomas Bailey	5	Recovery	Phosphates, 1 drachm 5 grains.
11	Aug., 1859	Wm. Topley	7	Recovery	Small oxalate of lime.
12	Oct. 8, 1859	Wm. Greaves	47	Death	A person of remarkably large size across the hips, and very fat. Lithic acid 6½ drachms. Death on 3rd day from infiltration of urine and consequent inflammation of pelvic and sub-peritoneal cellular tissues.

TABLE 5.—STONE IN THE FEMALE.

No.	Date.	Name.	Age.	Result.	Remarks.
1	1840	Hannah Squires	28	Recovery	Lithotritry; three operations; perfect recovery.
2	1846	Mrs. G.	60	Recovery	Superficial incision of urethra, and dilatation by Weiss's dilator. In a week after the operation she could retain the urine, but in subsequent years had occasional incontinence when she was out of health.
3	June, 1846	Mary Crosfield	63	Recovery	Simple dilatation; several small calculi removed by bullet-forceps.
4	June, 1849	Miss M.	28	Recovery	Superficial incision and dilatation; stone about the size of hazel-nut firmly grasped by a thickened bladder; permanent incontinence of urine.
5	Feb. 28, 1850	Eliza Robinson	5	Recovery	Simple dilatation; no incontinence.
6	Oct., 1852	Cath. Dauncey	4	Recovery	Simple dilatation; no incontinence.
7	Feb., 1858	Mary Grogat	48	Recovery	Simple dilatation; stone size of a chestnut; occasional incontinence.

Lateral Lithotomy.—These operations were 35 in number, giving a result of 22 recoveries and 13 deaths, or one death in two and two-thirds of the cases. In all these operations I used the knife and straight staff of my lamented friend and teacher, Mr. Aston Key. In all, a free external incision, and merely a superficial notching of the urethral surface of the prostate were aimed at. The next part of the operation consisted in dilating the prostate with the finger, and subsequently, if necessary, with the blunt gorget and the forceps.

Lithotritry.—The cases treated by lithotritry are fifteen in number, of which fourteen recovered and one died. To these might be added one case treated with apparent success by lithotritry. Symptoms of stone, however, speedily returned, accompanied with great irritability of the bladder rendering

lithotomy necessary. This case is placed in Table 1, which is devoted to Lateral Lithotomy.

Of the fifteen cases noted in Table 3, the number of "sittings" in fourteen is recorded. The smallest number being two, the largest twenty-two, and the average number of sittings in each case about six. In all these operations the utmost gentleness of manipulation was practised, and this was much promoted by using a screw lithotrite as small and light as was consistent with sufficient strength. The patient was generally laid on a couch, the pelvis being raised by pillows. Before the operation, the patient was desired to allow the bladder to become as fully distended with urine as it would easily bear. By observing this precaution I have very rarely had to inject the bladder with water. The irritation which the introduction of a second instrument causes was thus avoided; and I have imagined that the bladder is more tolerant of the presence of urine than of the foreign fluid water. For this practical suggestion I am indebted to the writings of Mr. Syme.

After several of the sittings rigors occurred, which passed off without any unpleasant result. In a few instances, they were followed by fever and considerable irritation of the bladder attended with viscid mucous deposit in the urine; but these symptoms generally subsided under the use of fomentations and opiates. Rigors have been less frequent in the later than in the earlier operations. This has, I believe, been due to the practice of giving the patient a glass of hot brandy and water with thirty drops of laudanum, and putting him into a warm bed immediately after the operation. Patients after the first sitting have been required to remain in bed for a day or two, and then allowed to go about, provided there was no fever, nor tenderness in the region of the bladder. After the subsequent sittings they were generally allowed to leave their bed in a few hours. In a few exceptional instances they were so tolerant of the operation that retirement to bed was dispensed with. In the case which proved fatal (Table 3, No. 8) the patient had three sittings. The first and second were borne remarkably well; the third was followed by fever and severe inflammation of the mucous membrane of the urinary passages. After death a cyst was found in the bladder, there was also hypertrophy and ulceration of the right kidney, and pyelitis of the left.

Median Lithotomy.—On referring to Table 4 it will be seen that this operation has been performed by me twelve times, with the result of eleven recoveries, and one death. Of these operations seven were performed on adults, there being six recoveries, and one death. I have also seen the operation performed by several of my friends in Leeds (a). As median lithotomy is now exciting much interest in the Profession, and is on my trial, I propose to enter more fully upon this part of my subject.

From the acknowledged fatality of lateral lithotomy in adults, it is not to be wondered at that Surgeons should feel a restlessness respecting it, and should cast about for some other proceeding which might be fraught with less danger. Hence the rise of lithotrixy, which when judiciously practised will, I believe, present in a majority of cases far more favourable results than lateral lithotomy; but still there remains a formidable minority of cases to which lithotrixy is inapplicable. Hence, also, the revival of median lithotomy, which seems not unlikely to supersede both lateral lithotomy and lithotrixy.

(a) The following is a statement of the total number of cases in which median lithotomy has been performed in Leeds up to the present date, December 1, 1859:—

Cases	Recoveries	Deaths.
1 By Mr. Smith	1	0
12 By Mr. Thomas P. Teale	11	1
4 By Mr. Samuel Hey	3	1
4 By Mr. C. G. Wheelhouse	4	0
1 By Mr. T. Pridgin Teale, jun.	0	1
1 By Mr. Seaton	1	0
23	20	3

Of these operations fifteen were performed on adults, resulting in thirteen recoveries and two deaths. In Mr. T. Pridgin Teale's case the patient was sixty-eight years of age, and had a very large prostate. The stone weighed three ounces and one drachm, and measured in its smallest circumference five inches and a half. There was about the same degree of resistance, chiefly at the external parts, to the extraction of the stone as is usually met with in removing a stone of this large size by the lateral operation. The patient proceeded remarkably well, and was considered nearly convalescent on the tenth day, after which he was seized with two severe attacks of erysipelas, under which he sunk on the fifteenth day. No examination after death was allowed.

It gives me much pleasure to have this opportunity of expressing my acknowledgments to Mr. Allarton, for the good service he has rendered the Profession by reviving and improving Mariano's median operation; and I strongly recommend any Surgeon, intending to adopt this operation, to study carefully the details of it described in his book.

The peculiar parts of this operation are an incision in the median line of the perinæum involving the whole extent of the membranous part of the urethra, and subsequent dilatation of the prostate.

A curved grooved staff, passed into the bladder, is hooked up against the pubes, and held steadily by an assistant. The operator introduces his left fore-finger into the rectum of the patient, so as to feel the apex of the prostate, and by pressure upwards to steady the staff within it. A strong, narrow-bladed scalpel or bistoury is plunged into the perinæum, about half-an-inch in front of the anus in adults, somewhat nearer the anus in children, and is thrust onwards until it strikes the groove of the staff immediately in front of the prostate. It is then carried forwards, in contact with the groove of the staff, so as to divide in its course the whole membranous part of the urethra, and the parts external to it in the median line, to such an extent as may be deemed sufficient to allow the extraction of the stone. The left fore-finger is now withdrawn from the rectum, and is passed deep into the incision to ascertain whether the membranous portion of the urethra has been completely divided, or any part of it, or the triangular ligament, offers resistance to the passage of the finger to the prostatic urethra. Should these structures not have been fairly divided, the knife is again inserted into the groove of the staff, and carried along it from above downwards.

In my earlier operations I aimed at the completion of the incision by one stroke of the knife, and in several instances accomplished it; but of late I have been less careful on this point, and have even preferred using the knife a second time, in order to secure the perfect division of the membranous part of the urethra. I have adopted this practice on account of the difficulty I encountered in an operation on a child, in passing the finger into the prostate. After the usual incision, considerable resistance to the passage of the finger was felt, and I thought it desirable to pass a beaked knife along the staff, thereby making a lateral incision of the prostate, and converting the operation into the lateral one.

On reflecting upon this case, I feel no doubt that the difficulty arose from the imperfect division of the membranous part of the urethra and the fibrous structure which it traverses, and that it would have been removed by running the knife down the groove of the staff. As the same difficulty has also been felt by others, it is desirable, when operating upon children, that the Surgeon should be provided with a beaked guide for the finger, which would more certainly and more easily secure its entrance into the prostate. An instrument of this description was shown me by Mr. Bowman, which he had requested Messrs. Weiss to prepare for him, and which appeared to me well-calculated to answer the purpose intended. Such an instrument would, in operations on children, be a more certain guide for the finger than the bulbed probe used by Mr. Allarton.

In children, the left forefinger of the operator is the best dilator, and generally the only one necessary. In adults, the question of dilatation demands more serious attention, as the finger alone will rarely be found sufficient, and some further mechanical aid will be required.

The instrument which I have until recently employed has been Weiss's three-branched dilator for the female urethra. The branches of this instrument, which expand by means of a screw, are slender, smooth, tapering somewhat towards their free extremity, at which part they measure, when closed, one-fourth of an inch in diameter, and at their base half an inch. They are four inches in length. With this instrument I have operated six times in adults; and in the majority of these cases found it to answer perfectly, but in some it appeared to be rather too slender and too short, although my object was attained by it. Anticipating the inconvenience that might arise from the use of this instrument in a subject extremely fat, or of large size, or with hypertrophied prostate, I consulted with Messrs. Weiss as to the best mode of remedying its defects. It was thought by us that two instruments, in extreme cases, should be used; one precisely similar to the old one, but with somewhat stronger blades, five inches in

length, and a second instrument with broader blades to carry on the dilatation commenced by the first. These instruments were used, immediately after I received them, by Mr. Seaton, of Leeds, and I had the satisfaction of observing that they performed their duty perfectly. Shortly afterwards I used them at the Leeds Infirmary, in a case of unusual difficulty (No. 12 in Table 4), which I must enter upon at some length.

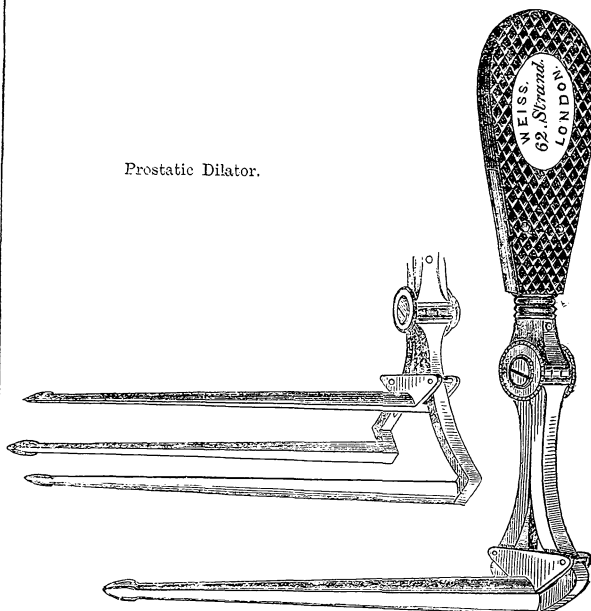

The patient, aged forty-seven, was of very large size, and enormously loaded with fat. My finger (which, however, is not a very long one) when introduced into the rectum could not reach the apex of the prostate, but could only feel the staff in the urethra anterior to it. Evidently the bladder was very remote from the perineum, but I quite expected that the new instruments would be long enough to reach it easily. The incision was freely made. The long, narrow-bladed dilator was introduced; and, when it was pressed deeply, so that its base was imbedded in the incision, I felt the stone. After dilatation had proceeded sufficiently, the second dilator, with broader but somewhat shorter blades, was introduced within the branches of the former, which was then withdrawn. The blades of the second instrument were gradually expanded, so as to allow of the full-sized lithotomy forceps being passed within them. Contrary to my expectation, I was now unable to pass the forceps onwards into the bladder, on account of an unusual solid resistance to their progress. I imagined this to be owing to the back part of the prostate not having been sufficiently dilated, in consequence of the branches of the second dilator not having reached fairly through the prostate. The staff was again introduced, and the long, narrow-bladed dilator was passed along its groove, and pressed deeply inwards, and expanded. The parts now became sufficiently dilated to allow of the ready passage of the forceps into the bladder, and the stone—not without difficulty, on account of its remoteness from the surface—was seized, and was extracted through the prostate and external parts without any resistance. The stone was of lithic acid, and weighed six drachms. So deeply was it seated, that when it was grasped by the forceps, this instrument, although of the largest size, was buried in the wound to within a finger's breadth of the rings of its handles.

On the third day after the operation the patient died from inflammation of the cellular tissue of the pelvis. The examination after death, conducted by Mr. R. G. Hardwick, House-Surgeon of the Infirmary, affords so instructive a lesson in reference to median lithotomy, that I cannot too strongly invite attention to it. The body of the patient was extremely fat, the abdominal layer of fat being two inches in thickness. The omentum and the sub-peritoneal cellular tissue of the abdomen and pelvis were in like manner extremely loaded with it, and a layer of fat one inch in thickness existed between the prostate and pubes. The bowels were distended with air; their peritoneal surface highly vascular, and there was a very slight quantity of lymph upon it. These appearances were more strongly marked towards the lower part of the abdomen. The cellular tissue of the pelvis, about the prostate and back part of the bladder, was evidently torn open, and was ecchymosed, softened, and much infiltrated with serum. The prostate was of natural size and structure. Its urethral surface exhibited, towards its vesical extremity, three wounds corresponding with the free extremities of the dilator, which, however, had not been long enough to reach fairly beyond the prostate. An instrument passed through the external wound into the bladder, showed that the distance from the perineum to the cavity of the bladder was five and a-half inches. The facts thus disclosed enable me to give the following explanation of the case. Owing to the extreme distance of the cavity of the bladder from the surface, namely, five inches and a-half, the long, narrow-bladed instrument, five inches in length, could only just reach the bladder when imbedded in the wound. As expansion proceeded, the instrument unavoidably receded to a small extent; the free ends of its blades thus became lodged within the prostate, and bore forcibly upon its mucous membrane. Three wounds were thus produced, which, however, in the aggregate, were not more extensive, and were no deeper than the incision made in lateral lithotomy. It further appears that the second and shorter dilator, introduced into the track of its predecessor, as soon as expansion was commenced, receded from the grasp of the prostate; and in its subsequent expansion, acted upon and tore up the cellular tissue between the prostate and rectum.

On reflecting upon this case, I feel convinced that, if I had been so fortunate as not to be possessed of the second broad-bladed dilator, and had thus been compelled to continue the dilatation to its full extent with the longer narrow-bladed instrument, the operation, even in this unfavourable subject, would have been completed without material difficulty; and that the wounds of the prostate would not have subjected the patient to greater risk than the wound of this part inflicted by lateral lithotomy.

Availing myself of the information thus obtained, I have decided upon using, in future, one dilator only, and for this purpose have had another narrow-bladed instrument constructed by Messrs. Weiss, stronger and longer than the former one. The blades of this instrument are five and a-half inches in length, terminating in a slight bulb, which would check the tendency they might otherwise have to recede from the bladder. The dimensions of the instrument, of which the engraving gives a good representation, are the following: The blades five and a-half inches long, their conjoint diameter when closed, three-quarters of an inch at the base, and half-an-inch at the bulb.

Prostatic Dilator.

The Act of Dilatation next requires careful attention, as upon its efficient performance the safety of the patient mainly depends. The dilator being introduced, the staff withdrawn, and the handle of the dilator turned up towards the abdomen, the Surgeon, or an assistant, slowly, and at short intervals, expands the blades of the instrument. The prostate generally offers only moderate resistance, while the chief obstacle to expansion exists in the parts external to it, namely, the fibrous structures of the perineum. The chief pain in this part of the operation is caused by the stretching of these fibres. To facilitate, therefore, their yielding, and to diminish the pain, they should be gently touched with the edge of the knife, either inferiorly or laterally. When the dilatation of the parts external to the prostate has been carried far enough, it will be found that the prostate itself has not been dilated quite to the same extent, on account of a slight yielding of the free extremities of the instrument; but it will generally have yielded enough to allow the large lithotomy-forceps to be introduced into the bladder, between the blades of the dilator, which may then be withdrawn. Should the stone be found to be very large, the blades of the forceps may be used for still further dilating the prostate. This is easily effected by withdrawing the forceps a little and then expanding its blades by repeated gentle efforts. The stone being seized, the process of extraction is effected by a moderate rotatory and tractile force, aided, when necessary, by slight touches of the bistoury applied to resisting bands of fibrous structure. It is better thus to overcome the resistance than by violent traction.

In this operation, as in the lateral, it is important to use forceps of rather large size relatively to the subject, as the stone is more easily seized by a large than by a small forceps. The blades, being smooth and broad, greatly protect the parts traversed from the rough surface of the stone.

Concluding Remarks.—It is an interesting question,—By what process the prostate, in median lithotomy, is widened so as to allow of the extraction of a stone through it? Is it by dilatation, or by laceration, or by both? At present, I presume, this question cannot be answered. Extensive observation, after death, of fatal cases can alone solve it. Experiments on the prostate in the dead body would prove little, as there is, I doubt not, a wide difference in the dilatibility, and in the proneness to laceration, of the living and of the dead prostate. It is, however, probable that in the living body the process which suffices for the extraction of a stone of moderate size is one of simple dilatation; and that, in the case of a large stone, it is attended with some solution of continuity both of the mucous membrane and of the proper structure of the prostate. But, in this respect, it will only be analogous to that which must take place, from the forcible stretching of these parts, when a large stone is removed by lateral lithotomy; and moreover, it is unattended with the casualties incident to a deep thrust of the knife.

As to the relative fatality of the two operations, which alone can determine their respective merits, it is too early to speak. Prolonged and varied experience of the median is required. But, when the lateral operation in adults is known to be attended with a sad fatality, it is the clear duty of Surgeons to try fairly other methods which afford a reasonable hope of better results. If the median should hereafter prove to be less fatal than the lateral, it must of necessity supersede it. If, on the contrary, the results of the median should be less favourable, it will become our bounden duty to relinquish the median operation.

As far as my own experience goes, the result of six recoveries in seven operations on the adult is favourable to the further testing of its merits. Difficulties may and will arise; but we must ascertain whether such difficulties are or are not insuperable.

It has been supposed that the median operation is applicable only to cases of small stones. My own impression is, that the largest stones, admitting of being extracted through the perinæum, may be removed by the median quite as readily as by the lateral operation, provided that the resistance afforded by tense perineal fibres be relieved by gently touching them with the knife. In Case No. 2 of Table 4 there were two stones, conjointly resembling in form an egg cut in two. These were seized and extracted as one stone, and were removed with perfect ease. They conjointly weighed $1\frac{1}{2}$ ounce, and measured four and a quarter inches in their smallest circumference. The stone which I saw my son extract weighed $3\frac{1}{2}$ ounces, and measured five and a-half inches in its smallest circumference. This stone, as I have already stated in a note, was removed with about the same degree of extracting force as is usually required in the lateral mode.

It is stated by some Surgeons that the operation is nearly bloodless. I have seen cases in which scarcely any blood was lost; but in most instances the bleeding at the time of operation was about the same as in lateral lithotomy. The subsequent draining, however, was much less. But, if bleeding of a more formidable character should occur after the median operation, we may feel assured that it does not proceed from large or from deep-seated vessels; and, moreover, the bleeding vessels may be rendered accessible to ligature or compression, by the aid of the three-branched dilator. In some cases I have thought that the stone was not seized so readily in the median as in the lateral operation; but on this point I would reserve an opinion until I have had further experience.

In conclusion, I will take a brief survey of the changes that have occurred in my own views and practice, as to the treatment of stone in adult males, since my first operation in 1826. These successive phases may be thus arranged:—

1. Lateral lithotomy in all cases.
2. Lateral lithotomy the rule, lithotripsy the exception.
3. Lithotripsy the rule, lateral lithotomy the exception.
4. Median lithotomy the rule, lithotripsy the exception.

In the early part of my practice lateral lithotomy was alone thought of. As soon, however, as lithotripsy received its last great improvement from the introduction of the screw-

lithotrite, I adopted the operation; first in select cases where the stone was small: afterwards it was extended to stones of larger size, until it became, in my estimation, the operation to be generally preferred, leaving, however, a large number of exceptional cases, in which the stone was great, or the prostate much enlarged, or the bladder highly irritable, for lateral lithotomy. The next change was caused by the revival of median lithotomy in an improved form; and from the limited experience I have yet had of this operation, I feel a strong conviction that it will be the one which I shall generally adopt, leaving lithotripsy to the few exceptional cases suitable for it, in which the patient has an insuperable objection to the knife.

It may be asked, Why was lateral lithotomy superseded in part by lithotripsy? In reply, it may be said that the acknowledged fatality of the former operation induced Surgeons to test the value of any other proposal which held out a better hope of success. In my own practice, thirty-five operations of lateral lithotomy in adults were attended with thirteen deaths, or one death in two and two-thirds of the cases. By the introduction of lithotripsy, the result is improved by the addition of fifteen cases, with only one death, giving a result from lateral lithotomy and lithotripsy conjointly, of fifty operations in adults, with fourteen deaths, or one death in three and a-half cases.

If the question were now asked, Why I would resort to any other operation when lithotripsy has furnished me with a result of fifteen cases with only one death, I would reply, that in each case so treated, the patient has generally had to submit to several operations or "sittings," and that any one of these sittings might have been, as some of them were, followed by symptoms severe enough to cause serious anxiety.

In the hope of diminishing the risks to which, from the plurality of operations, the patients subjected to lithotripsy are exposed, and of obtaining better results than lateral lithotomy affords, I have been desirous of giving a fair trial to the median operation.

I have now operated on adults seven times, three of these operations being performed on the same individual. The result of these has been one death in seven operations. If such a proportion of success can be maintained, it would be a great gain, as far as my own experience goes, upon lateral lithotomy, or even upon lateral lithotomy and lithotripsy conjointly. I have great expectation that such will be the result; for, if we except the fatal case already described, presenting extraordinary difficulties, which might probably be overcome hereafter, the remaining six recovered so favourably that it was difficult to believe the patients had been subjected to a grave operation. They formed a marked contrast with the adult patients who had undergone lateral lithotomy, and who subsequently recovered.

I have no hesitation in extending the median operation to children, although lateral lithotomy in children has presented me a result of eighteen operations without a single death. Yet a considerable number of these patients were seriously ill, and caused me much greater anxiety than has been felt for the few young subjects whom I have seen under the median operation.

Leeds.

PERSISTENCE OF PREGNANCY DURING AND AFTER UTERINE PHLEBITIS.

By LOUIS R. COOKE, M.R.C.S.E.

Assistant-Surgeon to the Royal Pimlico Dispensary.

THE accompanying case illustrates so forcibly the tenacity of life which is sometimes exhibited by the fetus in utero, under unfavourable circumstances, that I have thought it worthy of publication.

Mrs. A—, a lady, aged 22, has one living child, three years old, since the birth of which she has repeatedly aborted. The abortion, in each case, being attributable to some shock or violence accidentally applied. Her pregnancies have all had this peculiarity,—that she has never been made conscious of them by any symptom, except increase of size, until the period of delivery, although she has twice borne the fetus up to the time of six-and-a-half months, exclusive of the occasion on which she bore the living child. Her menses have never ceased, nor even been perceptibly affected by pregnancy; nor

does she remember to have experienced any indication of quickening, nor to have felt the subsequent movements of the fœtus. Eleven weeks ago, I was called upon to attend her, she having aborted, in consequence of having been turned over in a carriage. The fœtus, as nearly as I could judge upon a rather cursory examination, was of about two months. Her recovery progressed favourably until the eighth day, when the following symptoms began to appear:—tenderness over the lower part of abdomen, increased greatly by deep pressure, dry skin, loaded tongue, thirst, a painful state of the mammae, and a hard pulse of 105 in frequency, with great diminution of the lochial discharge, and extreme tenderness of the uterus, as felt per vaginam.

I treated this as a case of impending hysteritis, for a few days, when the next noteworthy set of symptoms made their appearance, consisting (in about their written order) of throbbing pain in the left groin, some fulness and tenderness in the course of the left femoral vein, pains (increased at night) in the joints of the extremities, which she attributed to rheumatism, a sense of putrid smell and taste, which was a source of constant harassment to her, and a discharge of a greenish colour and grumous character, from the vagina, which, she said, partook of the smell which was so constantly present in her nostrils. Coincidentally with these, her strength and appetite failed, her tongue became dry and brown, some traces of sordes made their appearance, her pulse reached 115 in frequency, and decreased in volume and force, her skin assumed a cachectic, almost cadaverous appearance, and two small abscesses formed on the fingers of the right hand. Having emptied the bowels by a cautious purge, I began to administer quinine in doses of five grains twice a-day, and allowed her a liberal amount of stimulants in the form of Port-wine, and the egg-mixture of the Pharmacopœia. Under this treatment, she gradually recovered, and went into the country for change of air. Here was, apparently, an end of the case; and I think it must be conceded to have been one presenting unmistakeable signs of hysteritis, and subsequent purulent absorption. On her return from the country, however, about a week ago; she summoned me to give an opinion on the gradually-increasing size of her abdomen, and the occurrence of pains, which, she insisted, were those of incipient labour, and which had commenced during the day. Finding that the bowels were in a constipated state, I directed her to take a tablespoonful of castor-oil, and left her, to be recalled on the next day, when the pains had assumed greater force and frequency. Upon examination I found the os uteri dilated to the size of a crown-piece, and a funis protruding, the abdomen of the fœtus presenting. Gradually dilating the os, I turned and delivered by the feet. It proved to be a fœtus of five months, showing scarcely any signs of decomposition, and unquestionably therefore twin with the one which had been expelled eleven weeks before.

She can give no reason for the last abortion, her health having been good, and she has no recollection of anything which can be construed into an exciting cause. It can readily be understood, however, that a woman having no suspicion of her pregnancy would fail to notice an amount of violence or exertion to which her attention would have been drawn had she known her condition, and been desirous to observe caution in reference to it.

35, Charlwood-street West, Belgrave-road.

CASE OF HYDROCELE TREATED BY THE IRON-WIRE SETON.

By J. B. THOMSON, L.R.C.S. Edin.

Resident-Surgeon of the General Prison of Scotland, Perth.

History.—F. H., aged 20, a labourer, has a hydrocele about the size of a small cocoa-nut, otherwise he is in the possession of good general health and a sound constitution. Although a prisoner, he does not belong to a class whose system may have been depraved and deteriorated by excesses of any kind; his offence being that of taking part in a riot.

The cause he assigns for the hydrocele is a blow received in a scuffle nine months ago; the swelling gradually increased in that time, but more rapidly of late.

September 17, 1858.—In consultation with Dr. Malcom it

was agreed to try the operation of simple acupuncture, and I pushed into the hydrocele, at different parts a middle-sized needle, which was followed by a drop or two of serum.

18th.—The swelling disappeared in less than thirty-six hours. The testicles were examined, and ascertained to be sound.

December 4, 1858.—The hydrocele had again accumulated to its former size, and it was resolved to try the method recommended by Professor Simpson, who kindly sent iron-wire for the purpose. A hæmorrhoidal needle was pushed from below upwards through the swelling, and the eye when emerged was armed with a double wire, and drawn backwards along the sac. The two wires were then clipped, and the upper and lower ends intertwined, avoiding any stricture or strangulation of the parts. The wires were withdrawn on the fourth day, when the swelling had gone, and it was hoped a radical cure was effected.

12th.—Symptoms of violent inflammation have supervened. This went on to suppuration of a severe and troublesome character, and lasted for four weeks. After the parts healed it appeared that there was thickening of the scrotum and obliteration of the sac below the points from which the wires had passed, but no complete cure. The hydrocele again formed, and filled at the upper part of sac, which never had been obliterated.

February 19.—Fluid accumulating.

March 26.—The sac again enlarged to the size of a small cocoa-nut; a second time the operation by the iron-wires was tried; the needle, at this time being armed with four threads of wire, being withdrawn on the third day. In two hours after the operation the fluid was all off. Inflammatory action followed in a few days after the withdrawal of the wires, more violent than at the former operation. For a month the patient was unable to leave his bed, and twice I had to give exit to matter in the scrotum by free incisions. Several abscesses took place, and at the upper opening, through which the wires were passed, the most troublesome of the abscesses took place, and was laid open April 26, 1859.

May 10.—This patient is pronounced well and cured.

June 25.—The cure seems radical, no threatening of a return.

Remarks.—The painful history of this case (after having heard much favourable testimony as to the iron-wire treatment) led me to suspect that the hydrocele was complicated with some other disease. But the most careful examination of the parts by Dr. Malcom and myself could not disclose any proof that this was other than a common case of hydrocele. It now appears that other Surgeons have met with similar cases adverse to this mode of operating.

What was the cause of failure in the foregoing case? Was the hydrocele bilocular and complex in character? Were the wires kept in too long? Was there a fault in the number of wires employed? Wherever the *origo mali* was, I know not, being content to state the facts and the results. One or two conclusions are unavoidable, viz. That violent inflammation may and does follow the use of iron-wire setons; and that even this violent inflammation may fail altogether to obliterate the cavity of the tunica vaginalis.

As to the controversy betwixt Drs. Gillespie and Young, are we to condemn altogether this operation without further experience or induction? Although our experience leads us not to commend, yet it is not fair altogether, to condemn the iron-wire setons. This is a matter of opinion. We are all too ready to jump at conclusions instead of merely stating facts. To such questions as those before us, one of our greatest English logicians, Bishop Butler, would say, "I have often wished that it had been the custom to lay before people, in matters of argument, nothing but premises."

Perth.

SALE OF VACCINE VIRUS BY A PHYSICIAN IN THE UNITED STATES.—A very common advertisement in the *Boston Medical Journal* is that of a Dr. Henry Martin Roxburg, Mass., who announces his readiness to forward vaccine virus of guaranteed freshness, purity, and efficiency, to any part of the United States, at the following rates:—Ten quills, prepared in such a manner that the lymph cannot chip off, for one dollar; and recent crusts, resulting from the drying of perfect, unruptured, and uncomplicated vesicles, securely mounted in gutta-percha, so that they can be used with great facility, without breaking or waste, one dollar each.

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

CLINICAL REPORT ON FAVUS.

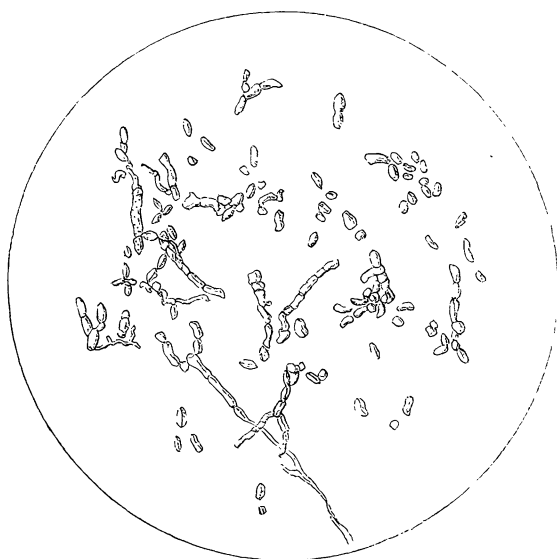

(Continued from page 557.)

NOMENCLATURE.

THE disease under consideration in the present Report has been described under a great variety of names. *Porrigio favosa*, *Porrigio lupinosa*, *True Porrigio*, *Tinea favosa*, *Favus*, *Tinea Maligna*, *Tinea lupinosa*, *Porrigophyta*, *Crusted* or *Honeycomb Ringworm*, and *Teigne Faveuse*, are a few of them. To make the confusion still greater, most authors have unnecessarily divided the disease into several varieties; thus, one of the most recent (Bazin) has a *Teigne faveuse urceolaire*, a *Teigne faveuse scutiforme*, and a *Teigne faveuse squarreuse*. As these qualifying adjectives refer, not to any real difference in the nature of the disease, but simply to accidental conditions of the crust in individual cases, there is not the least real use in admitting them. The term *Favus* is short, easy of remembrance, has never been applied (excepting by mistake) to any other disease, and describes one of the most prominent features of the eruption (the yellow colour of its crust). It has, moreover, more of authority in its support than any one of the others; and as it is not, like them, at all open to the risk of being misunderstood, it is by far the best that can be applied to this disease. If it is wished to describe the eruption in any particular case as being in large confluent patches, or in small scattered ones, it will be easy to say so in Saxon English, without loading the subject with the learned but confusing appellatives mentioned above.

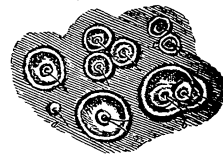

THE PATHOLOGY OF FAVUS.

In 1841 Gruby discovered that the crusts of favus consist of the sporules and thalli of a fungus to which he gave the name of *Achorion Schönleini*. His observation has been confirmed by the unanimous testimony of all who have since examined the disease. The writer has examined microscopically favus-crusts from at least thirty patients, and has invariably found them to consist almost wholly of the fungus in question. It has been figured by Dr. Corrigan, Mr. Wilson, M. Bazin, Wedl, Kuchenmeister, Dr. Beale, and Dr. Bennett, besides probably some others; and the illustrations given by all these, though exhibiting different degrees of artistic skill, coincide most closely. The woodcut here intro-

duced is from a sketch made by Mr. Tuffen West, and shows very correctly the appearances commonly met with when a small fragment of the crust is mixed up with water, and examined with a quarter-inch power. Two elements are seen

—sporules and thalli, the first consisting of oval highly-refractive cellules, either single or coherent; the second of prolonged and branching threads. If a small favus-crust be carefully removed entire from its bed, it is seen to be evenly-rounded in its deep surface, and slightly moist, as if it had been moulded in a little shallow cup. If the deeper and moist layers be selected for microscopic examination, the thalli will be found very abundant indeed, but nearer the upper dry surface, which has been exposed to the air, the sporules abound, and the thalli are very sparingly met with. In a vast majority of cases no suppuration, either in or beneath the favus-crust, can be detected, nor does the microscope discover any pus cells. It is a singular and important fact that the crust is made up of fungoid growth and granular matter, containing, as a rule, neither pus nor epidermal elements. The surface from which a crust has been removed does not bleed, nor is it abraded; on the contrary, it looks smooth, florid, and glossy, as if covered by a very delicate epithelial layer, which, no doubt, is the case. When the favus scabs are small and single, they are round and about a quarter of an inch across, while in the centre of each is seen a single hair. When, as is most often the case, the crusts are confluent and constitute a large irregular patch, hairs are still seen coming through them at parts and the arrangement of the single original spots, each with its central hair, may still be made out. There can be little doubt but that the opinion held by some authorities that the fungus develops itself *within the hair-follicles*, is correct. It would appear to grow from the epithelial lining of these cavities, which it fills and distends, opening their orifices and so expanding them, that instead of presenting the tubular form, they come to form shallow, round basins, each with a hair passing down its centre. The accompanying drawing, copied from Mr. Erasmus Wilson's work, will elucidate these statements.

THE RESULTS OF FAVUS.

If favus exist, as it usually does, for a long time, it effectually destroys the bulbs of the hairs whose follicles it infests. The result is, that the hairs are not reproduced, and that the patches remain bald, and the scalp thinned, glabrous, and in a semi-cicatrical condition. Very usually the scalps of adults who have suffered from the disease throughout their early life are almost wholly bald, or with only a few tufts of thin, dry hair, or, what is often seen, merely a fringe of hair surrounding the borders. This state of things is easily recognisable to one familiar with it, and even although no crust be present, may be very confidently identified. The cicatrical appearance is not caused by any actual scar, but is due to the thinning of the scalp tissues, consequent on the absorption of the hair bulbs and follicles, and the fat in which they are embedded. When favus attacks other parts of the body, it still develops itself in the hair-follicles, and from their shortness it is in such case a much more superficial disease, and far easier of eradication, than when it affects the scalp.

THE INVETERACY OF FAVUS.

Many and very various have been the remedies vaunted for the cure of favus. Most of them have, however, acquired their repute from errors in diagnosis, and from having been tried in diseases of a very different nature. In the descriptions which writers have given of the effects of "successful remedies for favus," there is in nine cases out of ten internal evidence that they did not refer to the affection to which alone that name ought to be applied. Of those authors who have made exact diagnosis, almost all admit that it is a most inveterate disease, often baffling every remedy. If the patient be seen whilst the disease is but just commencing and is limited to a single spot, more especially if that spot be on some part other than the scalp, a cure by prompt resort to cauterisation is easy. If, however, the scalp be extensively affected, such treatment is out of the question; although by the use of parasitocides in their various forms the affected parts may easily be cleaned and kept free from crust, yet a cure can scarcely be hoped. Over and over again have we met patients who had been discharged a few months before from one Hospital, as well, under treatment at another. The first case which the writer ever saw was that of a man, an out-patient at the York County

Hospital, fifteen years ago. This same man he met several years subsequently at St. Bartholomew's Hospital; again, a year or two later, at the Hospital for Diseases of the Skin; and for a fourth time at the Hull Infirmary; and there is reason to believe that he is still uncured.

Of the cases in our list, five (Nos. 12, 19, 21, 23, and 30) come in the category to which we have just alluded, of those easily curable, the disease not having in any of them lasted more than a week or two, and in none having attacked the scalp. In four others (Cases 3, 9, 26, and 34) no note has been preserved as to the duration of the affection. Placing these, then, aside, we have 35 cases, and of these the average period of duration, at the time they came under observation, had been *nearly seven years*. In this statement we have a fair measure of the inveteracy of the affection in question, since, from its loathsome character, it is one which almost always causes attentive and persevering attempts at cure. In one of the cases it had existed eighteen years, in spite of all treatment; in two others, sixteen years; in two, fifteen; and in four, twelve.

The explanation of the inveteracy of favus is to be found in the fact that it infests the hair follicles, and is, therefore, with difficulty accessible to parasitocides. It is easy enough to kill the fungus wherever it shows itself superficially, but to destroy completely its concealed spores, after it has once obtained fair possession of the scalp, seems, from experience, almost impossible.

AGE, SEX, AND SOCIAL CONDITION IN RESPECT TO COMPARATIVE LIABILITY TO FAVUS.

The writer has never yet witnessed favus in any one above the poorer class. The subject of Case 33 was a respectable farm labourer's wife, and the highest in the social scale in whom he has as yet seen it. Mr. Startin has informed him that he has but once seen it in private practice. Dr. Corrigan, Mr. Erichsen, and Mr. Erasmus Wilson all agree in the statement that it is only seen among the poor.

Our list of cases comprises eight in which the patients were Jews. Excluding three reported by Dr. Corrigan in Dublin, we have, of the thirty-five observed in England, five in which the patients are expressly stated to have been Irish. One of those recorded by Dr. Bennett, as having come under his observation in the Edinburgh Infirmary, was a Hindoo. It seems not improbable that individuals of Saxon parentage are somewhat less liable to favus than are either the Jews or Irish. The Jews appear to be especially prone to suffer from it. Dr. Corrigan writes that the disease is very rare in Ireland, and that, with unusually large opportunities for observation, he had not in the course of his life seen more than 30 cases. It would, however, require a very prolonged period indeed at any of our London Institutions, excepting, perhaps, that for Disease of the Skin, to collect as many as 30 examples of it. During five years' practice at the Metropolitan Free Hospital, the writer has seen but 10 cases, and of these, in 5 instances, the patients were Jews. It must be explained that at this Hospital, from its position, an unusually large proportion of Jew patients attend.

With regard to sex, we find that in 19 of our cases the patients were males, and 25 females. If we make allowance for the circumstance that girls are more likely to be persevering in seeking the cure of their malady, it would seem a legitimate conclusion, from these proportions, that sex exercises no influence in predisposing to it.

The ages of the patients in our series varied from 7 months to 17 years. We refer, of course, to the age at which the disease was reported to have begun, not to that of the sufferers at the time they came under notice. The average age at the date of attack was seven years. In several in which the age was stated to be unusually high, it may be suspected that the accounts given were not very precise. It is quite clear from the whole that favus is a disease which, although occasionally protracted into adult life, almost invariably begins before puberty, and usually in childhood. The entire series does not contain a single instance in which it began in an adult. That it may, however, be communicated to adults by artificial inoculation has been proved by several experimenters.

DOES FAVUS USUALLY OCCUR IN CONNEXION WITH DEBILITY, OR WITH ANY MARKED FORM OF GENERAL CACHEXIA?

This question has been rather hastily, and, for the most part, on conjectural and *a priori* reasoning, answered in the

affirmative by most writers. Thus Dr. Corrigan states, "To favour its propagation, poverty and sickness must first have reduced the body to a fit state to constitute the nidus of a parasitic plant." We admit that it occurs chiefly among the poor, but cannot grant that it does so because they are especially sickly. Surely, if sickness and enfeebled vital power were sufficient, we ought now and then to see it among the middle and upper classes. Mr. Wilson considers "defective nutrition" to be the "real cause of the disease." Dr. Jenner, on the other hand, states that the patient on whose case his clinical lecture was based was "in excellent health," and M. Bazin boldly calls the current doctrine in question, and avers that most of his patients were "of a robust constitution."

We will arrange the cases given in our table into four groups, with regard to their general health:—

1st. Those in robust health, the number of which is 25—Cases 2, 3, 6, 8, 9, 10, 14, 16, 17, 18, 19, 20, 21, 22, 23, 24, 26, 28, 30, 31, 32, 33, 41, 43, and 44.

2nd. Those in moderately good health (4 cases)—Cases 4, 5, 12, 15.

3rd. Those in delicate health, but having no special disease (7 cases)—Cases 1, 7, 11, 34, 35, 36, and 38;

And 4th. Those exhibiting signs of scrofula (comprising only a single instance)—Case 29.

We cannot but think that these facts furnish a tolerably conclusive answer to the question we have proposed. If an equal group of young persons were taken hap-hazard from the London population, we doubt much whether it would present a better average of health. While it is thus shown for certain that a large majority of those who suffer from the disease enjoy excellent general health, there is the converse fact, that multitudes in every walk of life exist whose vital stamina have been reduced very low indeed either by disease, diet, or starvation, but who yet do not show favus. A third class of facts must also be cited which tends in the same direction, namely—that it is not possible to modify the course of favus, much less to cure it, by attention to the general health. Among the cases which we have reported is one at the Hospital for Diseases of the Skin, the subject of which was a girl, under Mr. Startin's care, whom the Committee, from charitable motives, engaged as under-servant in the establishment. She was, of course, well fed and cared for, and the rapid improvement in her health bore ample testimony to the effects of the change of home. She remained, however, for two or three years in the Hospital without any advantage to her favus excepting what was temporarily obtained by the use of the sulphur ointment. It was quite clear that her improved nutrition exercised no influence whatever on her local affection. Many of the patients whose cases are recorded in our table, although in the poorer rank of life, had been in every respect well and sufficiently fed.

HAS FAVUS ANY CONNEXION WITH SCROFULA?

The answer to this question may perhaps be considered to have been given above; we wish to consider it, however, rather as having reference to tuberculous affections than to mere debility and depraved nutrition. Chronic swellings of the glands of the neck, not caused by distal sources of irritation, are probably regarded as, *par excellence*, the characteristics of scrofula. Now in favus of the scalp there always exists a distal source of irritation to the lymphatics, from which we should expect that now and then enlarged glands would result. We readily admit, however, that this eruption, unlike the common form of porrigo, does not generally cause engorgement of the lymphatics. If chronic suppuration in these glands should occur in the course of favus, we should be quite willing to admit that it was probably due to what is known as scrofulous taint of the constitution, and not to the eruption. Let us see how often, as a matter of clinical experience, this does occur. Of the whole forty-four cases, it is noted to have done so in but one instance (Case 29). In a second (Case 26), it is stated that the glands in the neck were slightly enlarged, but with the express qualification that the patient's aspect was "not strumous." It is true that in only about half the cases have we positive statement that the patient was not strumous; but, as we have included none the notes of which were not in some detail, it is fair to suppose that, had such a condition as suppurated glands existed in any of the others, it would have been adverted to. On the contrary, in most of these cases there is a conclusive statement that the patient was in good health. In

four cases the following expressions are respectively employed:—Case 24, "Thick-lipped, pallid, and rather strumous in aspect." Case 34, "Decided strumous diathesis; no active struma." Case 35, "Scrofulous aspect." Case 36, "Scrofulous and cachectic appearance." Now, we would venture to submit, that these expressions are not stronger than might be expected to apply to at least an equal proportion of any similar group of young persons brought together by accident; and their paucity in number, as well as deficiency in strength, is fatal to the notion that favus occurs by preference in those of tuberculous diathesis. We have not a single instance of phthisis in a favus patient, nor do we know of one on record. Conversely, we all know how common are the subjects both of phthisis and of advanced scrofula among our Hospital out-patients, and that they none of them become in consequence the subjects of favus also.

If favus were a disease induced by constitutional causes, whether by mere debility or by that diathesis known as struma, then it ought to be a not infrequent affection, and ought also to be met with in the most marked examples of those conditions; whereas the reverse of both these inferences is true. It is very rare, and it occurs for the most part in persons of good health.

IS FAVUS EVER TRANSMITTED HEREDITARILY?

From the line of argument which we have held throughout this Report, our readers will be quite prepared for a denial of the probability of the hereditary transmission of favus. We should, indeed, not allude to such an hypothesis, were it not that it has been mentioned by several authorities. The following is the only case which we possess bearing upon the question:—

E. and H. H., two sisters, aged respectively 12 and 7, came under our observation at the Hospital for Diseases of the Skin, on March 24, 1853. Favus existed in a most characteristic condition on the scalp of each. In the elder child it had been present for seven years, and in the younger one for only three months. Their mother, who came with them, stated that she had suffered from the same disease from early childhood up to her twenty-second year. Her statement was confirmed by the existing condition of her scalp. Her head was quite bald, with the exception of a fringe of very thin hair on the forehead; the integument being thinned, bright and glossy, in that semi-cicatricial condition usually left by cured favus. She stated that her father had suffered from the same disease in his whiskers and moustaches, and that it had lasted until his sixtieth year. Her grandmother had also had it on her scalp. One of her sisters also had it up to the present time, and two of this sister's children had been affected by it and got well. In Mrs. H.'s own family there were five children, besides the two suffering from the disease, and none of the others had ever had any form of cutaneous complaint, although their intercourse had been unrestricted. It is, of course, very doubtful whether the disease in all these instances was true favus or not. In the grandfather's case, in all probability, it had been sycosis only; but, even admitting the correctness of the woman's opinion, there is no reason for resorting to the theory of hereditary transmission, since it is manifest that opportunities for direct contagion must have occurred.

JONATHAN HUTCHINSON.

(To be continued.)

CASES OF PHANTOM TUMOURS.

METROPOLITAN FREE HOSPITAL.

HYSTERIC TYMPANITIS, OR PHANTOM TUMOUR OF VERY LARGE SIZE.

(Under the care of Dr. RAMSKILL and Dr. JONES.)

A VERY interesting example of hysteric tympanitis developed to a most unusual degree, has been for several years occasionally under notice at the Metropolitan Free Hospital. The subject of it is a girl, aged 19, unmarried, of peculiar physiognomy. Her countenance is expressive of intense morbid self-concernedness, the eyes downcast, and her aspect indicative of

moral duplicity. She was originally under the care of Dr. Ramskill, and for some months was an in-patient, in order that her case might be thoroughly observed.

The following notes of her case as to her state were made on Sept. 19, 1857.

"Her abdomen presents pretty exactly the appearance of a seven months' pregnancy, and her father even went to the length of turning her out of his house on the supposition that such was her condition. She applied to several Medical men, and very different opinions were expressed. On admission, it was found that the abdomen, although round and full, was of clear percussion note in every part, that the umbilicus was depressed instead of protruding, and that no tumour whatever could be felt. On vaginal examination the uterus was found small, and its cervix of due length. Respecting the absence of any tumour in the abdomen, some caution must be exercised in giving an opinion as she invariably holds the muscle so tense and board-like, that pressure cannot be made with any satisfactory results. At times the abdomen will appear to be larger on one side than on the other, and the external contour as a very large ovarian cyst is very exactly simulated, but then there always remains the clear percussion note, which is inconsistent with such a supposition."

The girl has since been in several other Hospitals; and she states that at one she was strongly urged to submit to the operation of paracentesis. Latterly she has again been attending at the Metropolitan Free, under the care of Dr. Jones. The prominence of her abdomen is now such that anyone not having witnessed the trial of chloroform, might well be excused for entertaining the utmost scepticism as to the possibility of its disappearance. It exactly resembles that of a patient at the full period of pregnancy. The eye of a careful observer may, however, detect some differences between the girl's bearing, and that of a pregnant or dropsical person. Her back is more arched, and her gait has less of the swinging motion from side to side—"waddling"—a difference no doubt due to the fact that she has no real weight to carry. About two weeks ago, in order again to make a thorough and satisfactory examination of the state of things, she was put under the full influence of chloroform.

"The abdomen rises evenly in all directions, and is most prominent about two inches below the level of the umbilicus. A brown streak extends from the umbilicus to the pubes. The area of clear tympanitic resonance extends over the whole front of the abdomen. The measurement over the most prominent part is thirty-three inches and one-third. Posteriorly both loins are dull on superficial percussion, the left side being entirely dull, even on the deepest percussion, while on the right a forcible stroke elicits a decided degree of resonance. As unconsciousness was supervening, under the influence of chloroform, the abdomen at once flattened, until not the slightest appearance of tumour existed. It was soft in all parts, and the promontory of the sacrum could very easily be felt. No escape of flatus was noticed.

"The abdomen now measures only thirty-one and a-half inches. Examined per vaginam the cervix uteri was found to be long, and in every way healthy; the uterus was freely moveable. Fæces are felt in the rectum, and a mass the size of a small egg, to the left side, about which some difference of opinion existed as to whether it was faecal or otherwise. As the influence of chloroform was passing off, the abdomen quickly resumed its original state, and in a few minutes, after, when she had regained consciousness, it was nearly as prominent as ever. She took the chloroform remarkably kindly, and recovered from its effect very quickly."

One of the interesting features in this case is its long continuance. All forms of anti-hysteric remedies have been exhausted upon it without the slightest result. Marriage is, indeed, in all probability, the only remedy which can be expected to influence a condition which partakes more of moral than of physical derangement. Several similar cases have recently been under our notice, in one of which the patient has been told by several Surgeons that she is the subject of ovarian dropsy. In this instance, also, as in the above, the patient is unmarried, and the same peculiarities of aspect are exhibited as have been just described. The value of the exhibition of chloroform as a means of diagnosis can be scarcely overrated. The cases are those to which mistakes in diagnosis are of the utmost importance, since they would inevitably lead either to unfounded imputation on the patient's chastity, or to the belief in the existence of incurable disease,

or to the attempted performance of most dangerous operations. The records of Surgery contain the narratives of not a few of such, in which either paracentesis has been performed, or the still more fatal mistake committed of laying open the abdomen, in order to extirpate an ovarian cyst. Against such errors the exhibition of chloroform affords entire security, and when any doubt offers about a case, it ought never to be omitted. As insensibility is induced, the board-like condition of the abdominal parietes, which had previously baffled all attempts to ascertain the exact state of the viscera, disappears, the diaphragm rises, the belly flattens out laterally, the anterior prominence disappears, and the hand can be passed back till it touches the sacral promontory.

Those desirous of further information on this subject, may refer to Dr. O'Ferrall's paper; to a series of cases published in this Journal some years ago; and to a note by Dr. Priestley on Hysteria Tympanitis, in our first volume for 1858.

SAMARITAN HOSPITAL.

CASE OF PHANTOM TUMOUR.

(Under the care of Mr. SPENCER WELLS.)

[From notes by Mr. PHILLIPS, House-Surgeon.]

F. M., aged 22, a well-made, fresh coloured, rather fat, unmarried woman was sent from the country to Mr. Spencer Wells as suffering under ovarian tumour, and as a fit subject for ovariectomy. She was admitted, June 7, 1859.

She stated that she had been in good health until two years ago; that since that time she had been obliged to give up all work, and that lately she had become thinner. She attributed the commencement of her illness to having received several severe kicks about the vulva and inner part of the thighs about a year before she had to give up work. She said that the kicks were followed by great swelling and pain, and afterwards by escape of blood, both fluid and in clots, by rectum and vagina; that there was a recurrence of this hæmorrhage several times during the year, and that the abdomen began to enlarge, and had continued to increase gradually up to the present time. She had undergone a great variety of treatment. She says the catamenia recur with only nine days' interval between the cessation of one and the commencement of the next period; that many clots come away; and that she suffers great pain in the back and loins for three days at least before the period, and for three days after it.

Present State.—Before examining the abdomen of this patient, and judging merely from her good colour, plumpness, and rather hysterical excitable manner, Mr. Wells at once expressed his belief that a very evident enlargement, visible through the dress, and giving her the appearance of a woman at the end of pregnancy, was not owing to ovarian disease. On uncovering the abdomen the nature of the case was instantly apparent. There was precisely that contraction of the false ribs, and the bow-like bulging or arching forwards of the recti from some four inches above the umbilicus down to the symphysis pubis, so well described by Dr. O'Ferrall, which is so very characteristic of these cases. She complained of great pain on pressure (even very slight pressure) on any part of the abdomen. The parietes were furnished with a thick layer of fat, so that the resonance on percussion was not tympanitic anywhere. The uterus was found to be in the normal state, but she complained that the examination was very painful, owing to tenderness of the vagina.

June 9.—Some Medical visitors in the Wards to-day being doubtful as to the nature of the tumour, and the accuracy of the diagnosis, Mr. Wells showed that as she was gradually brought under the influence of chloroform the abdominal tumour slowly but completely disappeared, the arched recti falling backwards, the diaphragm rising upwards, until, when she was completely narcotised, there was not the slightest appearance of any tumour, and the abdomen was perfectly soft and flaccid. It was curious, also, to observe, that as she recovered from the effects of the chloroform the recti recovered their tension, the diaphragm descended, and the tumour reappeared before she was completely awake. This was observed on more than one occasion when chloroform was used as a clinical demonstration of the case. It had been noticed that when she was asleep she lay flat down in bed,

though when she was awake she wanted to be propped up to relieve dyspnœa.

The Medical treatment consisted of assafoetida and valerian. Under this, and some good-humoured ridicule, she rapidly improved, and left the Hospital on the 25th, going to the very brother she said had kicked her so brutally.

SATURDAY, DECEMBER 10.

DR. SIMPSON'S LECTURES.

WE announce to our readers, with no common satisfaction, the gratifying fact that the invaluable Course of Lectures by Dr. Simpson, on the Diseases of Women, commenced in our last, and continued through the present volume, will be carried on through our volumes for next year.

The following is a mere sketch of the subjects to be treated in the forthcoming Lectures. No very definite order will be preserved, and there will probably be lectures on other subjects, but the value of the course to practical men may be estimated in some degree by a glance at the subjoined list; and a review of the Lectures which have already appeared, will be the best anticipatory test of the worth of those which are to follow. The Lectures recently published have been described by Dr. Adams, the learned translator of "Paulus Ægineta," as "more replete with the Medical learning of all ages, and the extensive results of original observation, than have appeared in this country for many years past."

OCCASIONAL CLINICAL LECTURES ON CASES IN OBSTETRIC SURGERY.

CRANIOCLASM—A NEW FORM OF CRANIOTOMY.

FIBROID TUMOURS AND POLYPI OF THE UTERUS.

INFLAMMATORY AFFECTIONS OF THE UTERUS AND VAGINA.

DISPLACEMENTS OF THE UTERUS.

DISEASES OF MENSTRUATION.

PHYSICAL DIAGNOSIS OF DISEASES OF THE UTERUS, OVARIES, ETC.

SURGICAL OPERATIONS ON THE VAGINA AND PERINEUM.

We leave this programme to speak for itself. Other arrangements are in progress, of which due notice will be given, calculated to make our forthcoming volumes more useful and popular than any of their predecessors.

RIFLE CORPS AND THE MEDICAL PROFESSION.

SOBERLY, steadily, and surely the very pith of the nation is arming. Twelve months more and our young men will be as familiar with the rifle and bayonet as—we had almost said with the cricket-bat, the oar, or the fowling-piece; but the comparison would not be just, neither would it convey a notion of the stern, quiet earnestness of the Volunteer movement—let us rather say, as familiar with the deadly weapons they are being trained to, as with their daily avocations. For the volunteer well knows that it is no trifling event which has

called him into existence, but a harsh necessity, which will be best met by a constant readiness that can only be obtained by dealing with his duties as a matter of necessary but ordinary every-day business—a thing to be done in the most effective manner, at the least cost, and with the least disturbance of domestic comfort, so that if the tug should come, it may be met with as much steadiness and precision as any incident of every-day life.

Well, the gentleman and commercial-man have already shouldered the rifle; the lawyer is following in the good course; the incipient divine is also entering the ranks; and the representatives of Physic are not lagging in the rear. But the position of Physic to the Volunteer movement is not that of other Professions, and a little careful consideration should be conceded to that position before the Doctor (nascent or mature) gives himself up unreservedly to the rifle and bayonet.

Thus far the Volunteer movement has been essentially what it ought to be—a matter of severe, unmistakeable business. Let it be so to the end. Suppose, for a moment, that it should unhappily chance (which Heaven forbid!) that the Volunteers should be called into the field, how would they be circumstanced in regard to Medical and Surgical care? This question immediately concerns the Medical Profession, and we should be prepared to answer it.

Now it is tolerably certain that if the Volunteers should be called out, whether in the event of invasion or of incoherent attacks upon different parts of the coast, the call will be sudden, and the possibility or fact of engagement sudden. And if the latter should happen, and no preparations have been made for the Surgical charge of the men engaged, but these requisites have been left to chance, it is hardly to be doubted that we should have re-enacted upon our own shores some of the harrowing scenes (of which we had sufficient examples during the Crimean war) that arise from want of foresight in preparing beforehand for the care and treatment of the wounded.

This may be regarded as looking too far a-head, and scarcely to be thought of in a thickly-populated and highly-civilised country. But we know not when and where the bolt will fall when it does fall; and if it be requisite to prepare for the bolt, it is equally necessary to prepare for the results of its fall. Moreover, we may rest assured that our assailants will give us little or no warning when they intend to strike; neither will they, as a matter of course, select those places for assault where we could most readily obviate the consequences of any neglect of which we had been guilty.

Again (and this brings us to the core of our subject), if, in the meantime, our junior Medical men and the cream of our schools of Medicine have, giving way to a righteous ardour, enrolled themselves and become part of the effective fighting-strength of Rifle Corps, whence would come the surgical aid which would be required under the contingencies contemplated?

We believe that, if a little forethought be exercised now, any evils which might arise from the lack of such aid in the time of action may be in a great measure prevented.

Let each Volunteer Corps appoint a proper staff of registered Medical men, with whom it might be optional whether they were drilled regularly with the corps or not, but who should be required to become sufficiently well acquainted with the drill and duties of the corps as to co-operate well with it in the field.

Above all, let the Medical students in the different Schools in the kingdom form themselves into special corps, or into special companies along with other corps. Let the students, in fact, keep themselves apart, so that in time of need they could be at once moulded into a *Medical Reserve*, available for service at any moment in any part of the kingdom. Let

them be trained thoroughly as riflemen if they wish it (as they ought to do), but let them not forget that they are doctors.

To make this scheme thoroughly effective, however, something more than drill, and a separate enrolment, would be necessary, to wit, the immediate introduction into all our Schools and Hospitals of such special tuition as would fit the student best to take upon himself at once and under all circumstances Surgical and Medical duties in the hospital or the field. This tuition could be readily carried out by a slight modification of the ordinary lectures on Medicine and Surgery, whether given *ex cathedra* or at the bed-side. The addition to the teachings of our Medical and Surgical Lecturers and Hospital Physicians and Surgeons of such rules of action and treatment as would most aid the student if he were attached to a corps of volunteers in the field, and would enable him to *do the most with the least means at command*, would be little irksome to the teachers and of considerable use to the student whether a volunteer or not, and might prove of vital importance to him if he were a volunteer.

Let every man in the Profession volunteer who is able to do so; but let not the Medical Volunteer forget that the country will look for the Doctor's duties from him, rather than the rifleman's, if war should ever infest our coasts.

THE WEEK.

We have frequently drawn attention to the indiscriminate manner in which Gratuitous Medical Relief is distributed to the general public, to the great injury of the Medical Profession, and without any corresponding benefit to the recipients of the proffered bounty. The gratuitous advice so offered is too often worthless, and the public are induced to undervalue the services of conscientious practitioners when they find that advice and medicines are lavished upon all comers without any inquiry as to their claims for Medical attendance. A correspondent has brought under our notice a case in point, which shows very clearly how grossly the poor are deceived and the Profession injured by the wholesale system of gratuitous attendance practised in some localities. In a certain dispensary, situated not a hundred miles from the north-western part of the Metropolis, and supported by the contributions of the surrounding clergy and gentry, it appears that medicines and attendance are supplied to about 1200 poor persons annually, and in cases that require it the patients are visited at their own homes. But the person who visits these poor people, is, as we are informed, an unqualified assistant, who dispenses physic and gives advice, and actually signs certificates of death in fatal cases. Our correspondent assures us that more than fifty deaths occur annually among these unfortunate patients, and that not ten out of that number have been attended by the Surgeon to the Dispensary, who has a large private practice to attend, and who leaves to the assistant alluded to the care of the Dispensary patients. Now the patients of such an establishment must belong to one of two classes; either they are quite unable to pay for Medical attendance, or they are able to pay, although perhaps a little. The former class are the proper objects for the attention of the parochial Surgeon, who, in the instance to which we refer, is, we understand, a thoroughly well-educated and enlightened Practitioner; and if they belong to the latter class, their reception of gratuitous Medical advice inflicts a positive injury upon the Practitioners in the district, and especially upon those who are just entering into practice, and who naturally expect that the better kind of the lower classes will become their first patients. But by the system we are now denouncing, both these classes receive, under the specious name of Gratuitous Medical Attendance, a cheap and a bad article, one which is useless, if not injurious, to themselves, and which reflects discredit upon the Medical Profession. No real

charity is therefore afforded to the poor of this Dispensary, as they are committed to the charge of an unqualified pretender; and the benevolent persons who subscribe their annual guinea for the twenty recommendations which their subscription procures, are practising a delusion upon themselves and are merely deceiving the sick poor.

Another horrible murder has been committed by a husband on the person of his wife. The man is manifestly a lunatic, and has only lately been discharged from an Asylum. This and other like instances of murders by lunatics which have occurred during the past year, will, we trust, tend to open the eyes of those who bear so heavily on what they call the Mad Doctors. We hope that these frightful occurrences will lead people to reflect that the welfare of the public is not to be forgotten when the interests of lunatics are called into question.

It will be recollected that the prosecution and conviction of the notorious quack impostors, Watters, Edwards, and Allen, were mainly owing to the exertions of a poor man, named Jones, who had been made the victim of the machinations of that confederacy. The whole of the prisoners have been punished by the laws of the country, and justice is therefore satisfied; but the prosecutor, Jones, has been put to an expense of upwards of £60 in his praiseworthy efforts to expose the imposture, and save the public from further deceptions. In order to reimburse Mr. Jones for the expenses to which he has incurred, a subscription has been opened, but we are sorry to learn that the amount hitherto subscribed amounts only to about £22, of which £5 5s. has been contributed by the London Medical Registration Association. An application was made to Mr. Norton last week, at the Lambeth Police-court, to bring the case of the prosecutor, Mr. Jones, before the public, and to interest the general sympathy in his behalf. The Magistrate, to whom many thanks are due for his exertions in the whole transaction, made some remarks on the apparent indifference of the Profession in filling the subscription list; but in these remarks we cannot altogether concur. Mr. Norton said that he regretted the want of liberality on the part of the Medical Profession, whose interests had been so much promoted by the exertions of Mr. Jones. Now, the prosecution of quacks, such as those composing the Bennett Gang, is a boon to the public much more than to the Profession, and it is to the public that the prosecutors should look for gratitude and compensation. The Medical Profession does not profess, and never did profess, to cure persons who are incurably deaf. If the public are cheated of their money by impostors, they have only themselves to blame; and they cannot, with justice or reason, appeal to the Medical Profession to shield them from the consequences of their own folly and credulity. Nevertheless, we are heartily sorry that the laws of this country do not provide a public prosecutor for such cases as those to which we now allude; for it is undoubtedly a very great hardship that a man should be exposed to trouble and great expense in exposing a gang of swindlers, who ought to be proceeded against at the national cost. Mr. Norton, in the course of his observations, stated that the Medical Registration Association had at its disposal the sum of £50,000,—clearly confounding the *Council* with the *Association*. The British Legislature, in its wisdom, does not take any steps to prevent or discourage quackery, but leaves John Bull free to employ quacks, if he thinks proper to do so; but it has done one beneficial service, by giving to the public a list of legally-qualified Practitioners, from whom any one may pick and choose for himself. If any person thinks proper to seek Medical aid beyond the pale of legitimacy, and is afterwards

deceived and cheated, he may become the object of commiseration to the general public, but he certainly has no right to look for any peculiar sympathy at the hands of the Medical Profession.

The following letter from the Director-General of the Army Medical Department, has been received in reply to the question whether attendance on a course of lectures on Operative Surgery is required, in addition to one of having personally operated on the dead body. It should be made known at once to all Medical students who wish to obtain the appointment of Assistant-Surgeon in the Army:—

“The candidate must produce a certificate of attendance upon a course of Operative Surgery, given separate and distinct from that of General Surgery, in addition to a certificate of having himself performed all the great operations on the dead body.—J. ALEXANDER.—Nov. 29, 1859.”

For the last eighteen months we have been endeavouring to impress upon the College of Physicians that upon them devolves the duty of licensing the General Practitioners of England to practise Medicine. The Edinburgh College made a premature move down a wrong path but in the right direction; and latterly the two Edinburgh Colleges have joined to give a double qualification after a combined examination. We are now happy to find that deputations have been appointed by the two London Colleges to confer together with a similar object. We can only repeat the hope we have again and again expressed, that no petty feelings of jealousy or self-interest may interfere with the completion of a project fraught with important public advantages.

The College of Physicians of London has, by its new bye-laws, changed the title of its Licentiates. Those who have been hitherto called Licentiates are in future to be designated Members of the College of Physicians. This change of title will necessarily require an alteration in the regulations of our Hospitals and Dispensaries, which provide for the appointment of Physicians. By these regulations it is at present provided that all applicants for the office of Physician shall be Fellows or *Licentiates* of the College. It will therefore be the duty of all Hospital Physicians and Surgeons to see that the alteration of the term Licentiate into Member is made by the Governors of their respective institutions. We understand that an official notification of the change of term will be made by the College itself to the different public Medical Institutions of the country.

A copy of the new Vaccination Rules issued by the Privy Council on Tuesday will be found in other columns. They are very important, and good as far as they go; but they are deficient, as they say nothing to encourage any hope of better pay for services which, if efficiently performed, ought to be adequately remunerated in some proportion to their national importance. An excellent leader in the *Morning Post* concludes as follows:—

“A more equitable rate of remuneration must be granted to public vaccinators. This may be accomplished in several ways, separately or combined; such as by augmenting the fee per case above its present miserable level of 1s. 6d., by dividing the work among fewer persons in populous places, and by granting small stipends in supplement of fees to those employed in thinly-peopled districts. In conclusion, let us refer to a topic which requires immediate attention. The want of an efficient system of vaccination in the colonies is a source of anxiety to all who have intelligently considered the

subject. There is at present a very large unvaccinated population growing up in our Australian and other colonies. The Legislature ought to see to this in time; otherwise, sooner or later, the small-pox, assisted by an epidemic influence, will burst out with fatal fury in many of our foreign possessions, and devastate them, as it has lately devastated unvaccinated Jamaica."

The papers of this week have recorded a double suicide of the most revolting character. A young man, aged 24, watchmaker and photographic artist, had lived a highly immoral life. His latest feat had been the seduction of a young girl of 18 years of age. So far as can be gathered from the evidence adduced at the inquest, it would seem that the young man had been for some little time in a very unsettled and unhappy state, and had occasionally said that he would commit suicide,—in short, that he would do anything except amend his ways. The idea of suicide would appear, indeed, to have been familiar with him, and after he had seduced the unfortunate young girl, he seems to have successfully inoculated her also with the idea of suicide. Prussic acid was obtained, and on the 6th inst. both the young man and girl were found dead in bed in a lodging-house, evidently from the effects of the poison. The following documents were discovered by the bedside :—

"DEAR FATHER,—I must now say farewell to this world. Your dutiful wife has driven me mad, and as to live to be so unhappy, I cannot. If I had not made up my mind to destroy myself, I should have shot Sarah out of revenge of my sister's death, which she was the cause of; and now she has been the cause of another deed too frightful to mention. You may think that I have lost all my senses,—but I can tell you that I am as sensible as you are at the present moment. I do not die alone, but the one I love dies with me. My last wish is that we may be buried together. If you wish to find us, it will be at ——. I remain, your disobedient Son,
"EDWARD SHIRLEY."

A second letter ran thus :—

"DEAR AUNT,—By the time you receive this, I shall be no more for this world.
Yours, most affectionately,
"ROSETTA GREENWOOD."

Now there was not one jot of evidence to show the existence of any mental aberration prior to the deed in the female; there was not a particle of evidence that would have had weight with a jury on a criminal charge, had the young man been arraigned at the bar; and yet, with hardly a moment's hesitation, the jury returned a verdict of "temporary insanity!" Truly this verdict in the hands of our coroners and their juries is becoming a mere form of expression. But let us reflect for a moment upon the certain effect of this verdict in the present case. The culminating criminal acts of two immoral individuals, one of whom has led an abominable life, are made by the verdict of a coroner's jury, a legitimate peg upon which to attach any amount of sympathy and pity for persons whose lives and ends are condemned by every law of sound morality. The morality is sunk in the feeling, our youth may look forward to suicide as a happy way of making a brilliant exit from troubles of their own creation. We remark, also, that the poisonous agent was prussic acid. Thirty per cent. of the suicides in England during the five years 1852-56, were occasioned by this deadly drug, in some form or other. It is an undoubted fact that the character of the deadly agent has an influence upon the number of suicides. In England it is but too evident that the law interposes no obstacle either to the perpetration or the method of perpetration of self-murder.

PROFESSOR LOVATI has been reinstated in the Chair of Obstetrics at the University of Pavia, of which he had been deprived by the Austrian Government for political reasons.

PUBLIC VACCINATION.

AT THE COUNCIL CHAMBER, WHITEHALL,

THE 1ST DAY OF DECEMBER, 1859.

BY THE LORDS OF HER MAJESTY'S MOST
HONOURABLE PRIVY COUNCIL.

To the Guardians of the Poor of all Unions and Parishes, to the Churchwardens and Overseers of all Parishes, Townships, and Places in which the Relief to the Poor is not administered by Guardians, in England and Wales, and to all Medical Practitioners.

WHEREAS by the Public Health Act, 1858, and by an Act since passed to perpetuate the same, it is enacted that the Privy Council may from time to time issue such regulations as they think fit, for securing the due qualification of persons to be thereafter contracted with by guardians and overseers of unions and parishes in England for the vaccination of persons resident in such unions and parishes, and for securing the efficient performance of vaccination by the persons already or thereafter to be contracted with as aforesaid ;—

Now, therefore, it is hereby ordered, by the Lords and others of her Majesty's Most Honourable Privy Council (of whom the Vice-President of the Committee of the said Privy Council on Education is one), that on and after the first day of January, 1860, the following Regulations shall be in force; viz. :—

Qualification of Contractors.

1. Except where the Privy Council, for reasons brought to their notice, see fit in particular cases otherwise to allow, no person shall in future be admitted as a contractor for vaccination, unless he possess the same qualifications as are required by the orders of the Poor Law Commissioners as qualifications for a District Medical Officer, and produce a special certificate, given, under such conditions as the Privy Council from time to time fix, by some public vaccinator whom the Privy Council authorise to act for the purpose, and by whom he has been duly instructed or examined in the practice of vaccination, and all that relates thereto :—

But the production of this special certificate on occasion of the contract being made may be dispensed with, if the certificate, or some other which the Privy Council judge to be of like effect, have been among the certificates or testimonials necessary for obtaining any diploma, licence or degree, which the candidate possesses ;—

And also, in respect of persons legally admitted to practise before this regulation comes into effect, the special certificate may be dispensed with, on condition that the contract, during one year from its making, continue subject to the approval of the Poor Law Board ;—

And all persons now contracted with shall be deemed to be qualified to be again contracted with.

Qualification of Deputies of Contractors.

2. Under the same conditions as are appointed for the admission of a contractor, any person qualified to be a contractor may, on the contractor's application, be admitted by the guardians or overseers to act as his occasional deputy ;—

But, if this admission be not part of the original contract, it must be notified by indorsement upon the contract; and at least 15 days before it is intended to take effect, a copy of the proposed indorsement, together with all requisite evidence of the qualification of the person whom it is proposed to admit, must be transmitted to the Poor Law Board.

Vaccination and Inspection.

3. All vaccinations and inspections under contract shall be performed by the contractor in person, or by some other contractor of the same union or parish acting for him, or by a deputy, duly admitted as above ;—

But at any station where the contractor is authorised (as above) to grant certificates, pupils and other candidates, aged not less than eighteen years, may, in his presence and under his direction, take part in vaccinating.

All vaccinations and inspections under contract shall be performed in accordance with the annexed "Instructions for Vaccinators under Contract."

Register of Cases.

4. Until some new form of vaccination-register be duly prescribed, the person who performs any vaccination under

contract shall, on the day when he performs it, legibly write in his register (as now provided) the letter R (for re-vaccination) against the name of every person, adult or adolescent, who, having in early life been successfully vaccinated, is re-vaccinated; and shall also enter in some column, or in the margin of the register, the source whence the lymph used in the vaccination was obtained:—

Thus: the name, or number (if any) in the register, of the subject from whom the lymph was taken; or "N.V.E.," if the lymph was sent by the National Vaccine Establishment; or the name or description of any other source;—

And where the vaccination or the inspection is done by a person acting as deputy for the contractor, the deputy shall write the initials of his name in the register side by side with the entry of the case; viz., in the left margin of the page, if it be a vaccination which he performs, or in the right margin of the page, if it be an inspection which he performs.

Contracts.

5. Guardians and overseers, in their respective unions and parishes, shall forthwith take measures to bring the performance of public vaccination into conformity with these regulations.

WM. L. BATHURST.

[A copy of the Instructions for Vaccinators shall appear next week.]

NOTIFICATION.

QUALIFICATION OF PUBLIC VACCINATORS.

Whereas under the provisions of the Public Health Act, 1858, and of an Act since passed to perpetuate the same, the Privy Council have this day issued regulations "for securing the due qualification of persons to be hereafter contracted with by guardians and overseers of unions and parishes in England for the vaccination of persons resident in such unions and parishes, and for securing the efficient performance of vaccination by the persons already or hereafter to be contracted with as aforesaid;" and whereas in these regulations it is, among other things, required, that, on and after the first day of January, 1860, persons to be contracted with for vaccination, and persons to be allowed to act in their stead, shall, except in certain cases, produce evidence of being duly qualified in all that relates to the practice of vaccination; which evidence must consist in a certificate given, after due instruction or examination, by some public vaccinator whom the Privy Council authorise to act for the purpose:—

NOTICE IS HEREBY GIVEN,—

1. That, subject to orders of the Privy Council, the public vaccinators named in the following list are authorised by the Privy Council to give the required certificates of proficiency in vaccination to persons whom they have instructed therein, and those whose names in the following list are printed in italic letters are also authorised to give such certificates after examination to persons whom they have not themselves instructed.

Cities and Towns having Educational Vaccinating Stations.	Public Vaccinators authorised to give Certificates of Proficiency in Vaccination.	Places used as Educational Vaccinating Stations.
LONDON	Mr. James Furness Marson	(Principal Station) Surrey Chapel, Blackfriars-road.
	Mr. William Prue Jordan.....	(West Station) 14, Lower Belgrave-street.
	Mr. William Jones Lewis.....	(East Station) 1, Well-street, Wellclose-square.
	Mr. George Simpson.....	(North Station) Tottenham-court Chapel, Tottenham-court-road.
BIRMINGHAM.	Mr. Samuel Spratley	The General Dispensary.
BRISTOL	Mr. William Yeoman Sheppard	7, St. Augustine's-place.
HULL	Mr. John Hare Gibson	29, Nile-street.
LIVERPOOL	Mr. Arthur Browne Steele, Mr. John Henry Wilson, Mr. John Fenton, and Mr. James Gilmour, acting conjointly, or at least two of them together.	The Ladies' Charity, Parr-street.
MANCHESTER.	Mr. Evan Thomas	159, Rochdale-road.
NEWCASTLE.	Dr. Thomas Fothergill McNay.....	Bricklayers' Hall, Castle-garth
OXFORD	Mr. Edward Law Hussey	104, St. Aldate's.
SHEFFIELD	Mr. George Atkin.....	Park Chapel, South-street.

2. That on and after the first day of January, 1860, the vaccinating-stations, at which these vaccinators officiate, will be open, under conditions set forth in the annexed memorandum, for the purposes of teaching and examination; and,

3. That from time to time, as additions are made by the Privy Council to the list of persons whom they now authorise to give certificates of proficiency in vaccination, the names of the other persons thus authorised will be published in the *London Gazette*.

WM. L. BATHURST.

Council Office, 1st December, 1859.

Memorandum of Arrangements made in England for the Public Teaching of Vaccination, and for the granting of such Certificates of Proficiency in Vaccination as will qualify the bearers (if otherwise eligible) to be contracted with by Guardians and Overseers for the performance of Public Vaccination.

The stations at present established for educational purposes are all in places where there are recognised Medical schools. They are stations where the appointed public vaccinator uniformly attends in person, and where the annual number of vaccinations, as compared with the number of vaccinating days, is sufficiently large to promise that the student, during his period of attendance, will, as a rule, always find many cases together for observation. They are stations from which vaccine lymph is furnished for the public service; the vaccinators in charge of them having, for this purpose, been selected by the National Vaccine Board to be members of the National Vaccine Establishment.

The vaccinator of an educational vaccinating-station, during his attendance thereat, will exhibit and explain the course and characters of the vaccine vesicle, will practically teach the best method or methods of performing vaccination, and of taking lymph for present or future use, will inculcate all precautions which are necessary with regard to the health of subjects proposed for vaccination, and with regard to the selection and preservation of lymph, and will give all such other instruction as is requisite for the scientific and successful performance of vaccination and re-vaccination. During his course of instruction, he will make provision to ensure that always some cases come for inspection on the tenth, as well as on the eighth day; and, for the purpose of showing these cases to his pupils he will give, on the day appointed for their coming, a second weekly attendance at his station. He will further enable and direct each pupil to see at least six cases of vaccination on at least two other days of their progress, viz. both before the eighth and after the tenth day. In the teacher's presence, and under his direction, any pupil, aged not less than 18 years, may take part in vaccinating; but not till he have attended the station on at least two vaccinating days.

Any person, desirous of being admitted as pupil at an educational vaccinating-station, shall pay a fee not exceeding one guinea, and thereupon receive a ticket entitling him to attend the public vaccinations of the teacher. When the pupil has attended at the station during the times of vaccinating and teaching, for at least six weeks, the teacher, if satisfied of his proficiency, shall, on receiving back his ticket, but without further payment, give him a Certificate in the appointed form.

At stations where the teacher is also authorised to give certificates of proficiency in vaccination to persons whom he has not himself instructed therein, such persons, will, on appointed occasions, be examined by the teacher, on payment of a fee not exceeding one guinea, and if he find them competent, receive certificates accordingly, in case of failure to pass this examination, the candidate may be admitted to a second examination on payment of a fee not exceeding half a guinea.

The Certificate of Proficiency will be understood to imply—and therefore the teacher who signs it will have taken care to ascertain, that the person to whom it is given can skilfully vaccinate, both with liquid lymph (including such as is preserved in capillary tubes) and also from ivory points;—that he can properly charge ivory points or capillary tubes with lymph;—that he is aware of the relative advantages of recent and preserved lymph, and of all precautions which are requisite in using the latter;—that, from among vaccinated subjects presented for eighth-day inspection, he can select and give

reasons for preferring, those who are fittest to furnish lymph;—that, besides being thoroughly familiar with all local changes which, from first to last, normally ensue on vaccination, he has learnt what causes may accelerate or retard the local changes, or give them undue severity, or otherwise render them irregular;—that he is well informed as to the constitutional effects of vaccination (including the eruptions which sometimes follow it) and as to the treatment which cases of vaccination, under various circumstances, may require;—that he knows how far the protective influence of vaccination is affected by lapse of time, and how far by the mode in which vaccination is performed—especially by the number or size of vesicles, and knows generally under what circumstances re-vaccination is to be recommended;—finally, that he is acquainted with the laws and regulations relative to public vaccination, and understands the local arrangements which are necessary for maintaining a constant supply of lymph.

REVIEWS.

Lectures on the Diseases of Infancy and Childhood. By CHARLES WEST, M.D. Fourth Edition. London: 1859. 8vo. Pp. 755.

If there had been one of our readers at all doubtful as to the ability of Dr. West to afford valuable and reliable information upon the Diseases of Children, any doubts would have been dispelled by a perusal of the excellent lecture we published November 26th, "On Sudden Death in Infancy and Childhood." Doubters, however, must be few and far between; for the three former editions of the work now before us have placed the author in the foremost rank of those Physicians who have devoted special attention to the diseases of early life. Dr. West has enjoyed unusual opportunities for observation; for, as he says, these Lectures "embody the results of 900 observations and 288 post-mortem examinations made among nearly 30,000 children, who, during the past twenty years, have come under my care." The results of all this experience are placed before the reader in an attractive form, securing for the author the palm already awarded to him as one of the most careful and elegant of British Medical authors.

We attempt no analysis of this edition, but may refer the reader to some of the chapters to which the largest additions have been made,—those on Diphtheria, Disorders of the Mind, and Idiocy, for instance—as a proof that the work is really a new edition; not a mere reprint. In its present shape it will be found of the greatest possible service in the every-day practice of nine-tenths of the Profession.

What is Psychology? By J. STEVENSON BUSHNAN, M.D. Exeter: 1859.

THIS is a reprint from the October number of the *Journal of Mental Science*; and we are glad to offer a kindly welcome to Dr. Bushnan, on finding him again in the field of Medical literature—the hunting field, we might say,—for to run down quackery and "omne quod exit in hum" seems to be his mission. Miss Martineau and her Master, Homœopathy and the Homœopaths, Mesmerism and Clairvoyance, all have quailed before him. Nor, while attacking monster impostures has he lost sight of smaller professional peccadilloes, as is well testified in his papers "Look at Home" in this Journal. Now, Dr. Bushnan cavils at the abuse of words; and argues that the term "Psychology" and "Psychologists" do not mean what modern philology (?) would make them mean—Madness and Mad Doctors. To talk of "Psychological Medicine" is, he thinks, simply an absurdity.

"Their use of the word," says Dr. Bushnan, "is psychology run mad. We cannot always discover whether it be the doctor or his patients who are the objects of psychology; whether psychology be madness or mad medicine; whether it be like that 'metaphysical aid' by which Lady Macbeth expected her husband to obtain a crown; or, like the character of the lady of whom the poet speaks:

"Call her the metaphysics of her sex,
And say she tortures wits as quarians vex Physicians."

But for Dr. Bushnan's views of what "Psychology" really is, we must refer the reader to the paper before us. Perhaps

the Author will some day tell us what he thinks of the modern use of the words "Pathology" and "Pathologist;" terms much more commonly abused than those he attacks in a style so vigorous and amusing.

A System of Instruction in Qualitative Chemical Analysis. By C. R. FRESenius. Fifth Edition. Edited by J. LLOYD BULLOCK, F.C.S. London: 1859. 8vo. Pp. 310.

A fifth English after a ninth German edition is enough to stamp any book with the mark of popular utility. No recent work on Chemical Analysis has shaken the confidence of European chemists in this work of Fresenius; and the edition before us affords full proof that author and translator have worked cordially together to bring up every section to the most recent advances made in analytical chemistry.

Ure's Dictionary of Arts, Manufactures, and Mines. New Edition, Parts 1 and 2. London: 1859.

THE preparation of a new edition of the very popular and useful Dictionary of Dr. Ure has been very wisely intrusted to Mr. Robert Hunt, who has obtained the services of a staff of contributors whose names are a full guarantee that the articles they furnish upon their own special subjects will be thoroughly "up to the mark." The first and second parts, from A to BOR, are now before us, and give fair augury of a very complete work, profusely illustrated by excellent woodcuts.

Mayne's Expository Lexicon. Part IX. London: 1859.

As this work will very soon be completed, and we shall then have to notice it at some length, we shall now simply state that it is really completed in the present part; but that some addenda have been found necessary, and about a dozen pages are devoted to terms from A to ALT.

PROGRESS OF MEDICAL SCIENCE

Selections from Foreign Journals.

ON GANGRENOUS PHLEGMON, AND DIFFUSED SUPPURATING PHLEGMON.

By Professor THIRY.

IN a recent lecture, delivered by M. Thiry at the Brussels University, he referred to the confounding by authors of different pathological conditions under the terms erysipelatous phlegmon, gangrenous phlegmon, phlegmonous erysipelas, and diffused phlegmon, treating of these as if they were one and the same affection. In his view of the case, *erysipelatous phlegmon* is an inflammation of the cellular tissue, followed by erysipelas or inflammation of the suprajacent skin—the inflammation spreading from within outwards. It is just the contrary in *phlegmonous erysipelas*, in which inflammation commencing in the skin extends to the subjacent cellular tissue. The two conditions differ only in their primary seat and mode of appearance; and while erysipelatous phlegmon exists as a local manifestation prior to the appearance of febrile symptoms, these precede, or at all events, accompany the establishment of phlegmonous erysipelas. After some days the two affections lead to the same pathological consequence, and from that period their progress, duration, and treatment, are identical.

The general principles for the treatment of inflammation and erysipelas being here applicable, M. Thiry dwells no longer upon this part of the subject but next calls attention to the differences recognisable between *gangrenous phlegmon* and *diffuse suppurating phlegmon*. Gangrenous phlegmon is inflammation of the cellular tissue terminating in gangrene; while diffused suppurating phlegmon is inflammation terminating in suppuration, and becoming propagated from point to point to a distance from its origin, by virtue of special anatomical dispositions. The pathognomic character of the former is immediate gangrene, and that of the latter suppuration—gangrene, when it does appear, being a complication. Gangrenous phlegmon almost always arises from a general cause, and diffused phlegmon from a local one. The latter is

only met with when resisting aponeuroses present obstacles to the easy flow of pus, while gangrenous phlegmon may be domiciled anywhere. The symptoms of the two affections have little resemblance; their course is entirely different, and the treatment they require, at all events at first, is of an opposite character.

Anatomical Characters.—When an incision is made into a *gangrenous phlegmon* at an early period, an abundant serosity is found infiltrated into the cellular tissue, giving this, from the distension produced, an appearance of considerable thickening. The cellular tissue presents a characteristic reddish appearance. At certain points it becomes torn and detached in the form of small elongated masses, which may be drawn out in shreds of varying length, exhaling a fetid, gangrenous odour. At a more advanced stage pus is produced, this being the signal of the elimination of the eschars. The skin covering the phlegmon, becomes in its turn gangrened in more or less extent, owing to the destruction of the nutrient vessels emerging from the cellular tissue. Finally, there remains, after the expulsion of the mortified tissue, an ulcerated surface, with detached edges—the skin continuing attached to the subjacent parts only by organised bridges, which must be carefully preserved, or the integuments will be entirely deprived of nutrition. When we pass the bistoury into a commencing *diffused phlegmon* we find the cellular tissue tumified and infiltrated, and vessels containing a reddish fluid traverse it in all directions. The sanguinolent serosity soon gives place to pus in a state of infiltration, which at a later period, the meshes of the cellular tissue becoming torn, becomes collected in several little centres. The destructive action going on, these at last become confounded together, and constitute a large irregular cavity, traversed here and there by some cellular partitions. Gangrenous phlegmon may arise wherever there is cellular tissue, but is more commonly met with at the extremities than on the trunk. Diffuse phlegmon is essentially subaponeurotic, and is very often met with in the hand and forearm. It is usually developed along the vessels or nerves or muscular and tendinous sheaths; and sometimes suddenly arises close to a comminutive fracture, or a wound of a joint, especially the knee-joint.

Etiology.—In general *gangrenous phlegmon* is observed only under the influence of causes affecting the entire economy, as, for example, the slow poisoning following a dissection-wound. Progressive debility, moral affections gradually undermining the system, or a considerable anasarca may give rise to it, as also may urinary fistula or fistula in ano, when inducing a general “*toxicæmia*.” When it follows external violence, a careful examination will almost always show that this has only served to localise an affection, which otherwise would have manifested itself in some other region. *Diffused phlegmon* is a consequence of an external irritant, wounds, contusions, injuries to bones, sprains, or the presence of foreign bodies. When it arises spontaneously, without apparent cause, it seems still to precede rather than to follow the general morbid conditions observed.

Symptoms.—In *gangrenous phlegmon* general symptoms of a very alarming character precede the local manifestations. These latter present three distinct periods. In the first there is pain of a severe, tense, pungent character; the redness soon assumes a deep brown shade, the swelling is considerable, and the skin, easily depressed by the finger, becomes covered with sanguinolent phlyctenæ. Next, black, gangrenous spots appear here and there, and there is a false sensation of fluctuation over a great extent, frequently accompanied by crepitation. The second stage is one of bursting and elimination, and the third is one of reparation, always a tedious process. In *diffused phlegmon* the local symptoms first appear. The finger, exploring the seat of pain, meets with a doughy resistance, and the skin assumes a rose tint. After these signs have manifested themselves, shivering ushers in general symptoms; and the pain, at first localised, irradiates along the limb, and becomes pulsatile. The swelling assumes larger and larger proportions, until it may involve the whole limb, and it is characterised by excessive tension. The tendinous sheaths and vessels have acted as conductors to the diseased process, and are now all dissected out by the destruction of the subaponeurotic cellular tissue; and after the ulceration of the surface a vast, irregular cavity is exposed. After the evacuation of the pus, naturally or artificially, the general symptoms, which had acquired a

frightful intensity, subside. Both affections are acute, and of prolonged duration; but, setting aside all complications, gangrenous phlegmon occupies most time. Its devastations are greater, and the general condition is more difficult to combat. Taken altogether, it is a much more serious affection than diffuse phlegmon.

Treatment.—The formation of *gangrenous phlegmon*, when announced by general symptoms, cannot be prevented, do what the Surgeon will, he having only the power of limiting it, and favouring its termination. *Diffuse phlegmon* may be attacked with advantage from the very commencement, and its establishment may be prevented. Rarely, if ever, can antiphlogistics, whether general or local, be employed in gangrenous phlegmon, adding as they usually would, to the already too great debility of the patient. As soon as the disease or traumatic lesion upon which the *gangrenous phlegmon* depends has been treated, quinine should be at once resorted to. After a few days, when any saburral condition of the alimentary canal is present, a grain or two of tartar emetic, divided into two or three doses, and given in the form of lavement, is of great advantage. Dupuytren practised numerous and large incisions at an early stage, but the practice is not of use except when strangulation prevails; and even then the incisions, though extensive, should not be multiplied, or the intervening flaps of skin will themselves become gangrened, owing to the circulation and nutrition proving insufficient. They are usually only required when suppuration is appreciable. After their employment, cataplasms, tepid, aromatised baths, or aromatic injections (as tinctures of iodine, myrrh, or benzoïn, spirit of camphor, and Labarraque's solution), are to be continued until complete elimination has taken place. Tonics and a good diet are also required.

In the case of *diffuse phlegmon* we should at once, without hesitation, make a large and deep incision, comprising even a portion of healthy tissue. The incision is to be followed by a tepid, emollient bath; and the part having been covered with mercurial ointment, an emollient cataplasm is to be applied, resorting also to compression of the limb from its extremity upwards to the level of the incision. If the timidity of the patient opposes early incision, a large number of leeches should be applied, and mercurial frictions, followed by a cataplasm, may follow. In the robust, bleeding may be performed, although usually a few grains of tartar emetic will prove of more eventual benefit, and it may be employed in larger and longer-continued doses than in the case of gangrenous phlegmon. If the Surgeon has not anticipated the formation of pus, he must, as soon as this is recognised, evacuate it by a deep and large incision, so as to prevent its destructive burrowing. After the evacuation the part is placed in a tepid bath. Two or three times a-day mercurial frictions are applied, the part then being covered by a poultice, or enveloped in a bandage.—*Presse Médicale Belge*, No. 12.

EXCERPTA MINORA.

Castration in Erotomania.—Dr. Bell, in a letter to Dr. Bigelow upon this subject, says:—“I have often been consulted as to tying the spermatic arteries, the vasa deferentia, and removal of the testes in the forms of insanity connected with spermatorrhœa. I have known it done repeatedly. In one case, Dr. — castrated a clean-gone onanist, who subsequently rallied, became an active man, and the Doctor told me that he never met him that he did not receive his blessing for the great favour he had conferred on him. In another case of self-perpetrated castration, under a similar state of mind, entire restoration to peace of mind and energy was produced. On the other hand, in all the Lunatic Hospital cases where I have known it done, no valuable results have followed. At the Ohio Hospital, some years ago, it was tried on quite an extensive scale. No case of improvement followed; indeed, Dr. Awl told me that in one patient who previously was quiet and contented, a permanent and dangerous condition of irritability followed. In the case of the young woman alluded to (a desperate case of nymphomania, terminating eventually in suicide, in which removal of the ovaria had been suggested) I confess I should recoil from such a remedy. I have found that heavy doses of opium, long continued, do control the nymphomaniacal disposition dependent on no local irritation.”—*Boston Medical Journal*, vol. lxi., p. 166.

Iodine Injections in Spina Bifida.—Drs. Brainard and Crawford have now treated seven cases in this way, and of these

five were cured of the disease, one dying seven months after of chronic hydrocephalus. The fluid injected consists of a solution of iodine and iodide of potassium, in water, the amount varying from a quarter of a grain to four grains of iodine and three times that quantity of iodide, dissolved in from one drachm to several ounces of water. The immediate effect of the operation is pain and some febrile reaction, and, if the quantity injected be large, some symptoms of cerebral compression are apt to occur. The injections are to be repeated as often as necessary, their strength being increased. The puncture should be made in the sound skin, at the side of the tumour, and no more of the fluid of the tumour should be evacuated than the quantity of the injection about to be thrown in. After the operation, collodion should be applied, in order to contract the skin, and this should be continued for some months after the swelling has disappeared.—*Ibid.*, p. 246.

Discharge of the Appendix Vermiformis from the Bowels.—Dr. Jackson related this unique case to the Boston Medical Society. A robust farmer, aged 24, after suffering several days from vomiting, and constipation, and symptoms much resembling those of peritonitis, became convalescent and passed a substance which proved, on examination, to be without doubt the appendix vermiformis, measuring $3\frac{1}{4}$ inches in length. It was in a fetid, gangrenous condition, and presented several openings. He has continued perfectly well since, a period now of three years. The line of separation is not transverse to the length of the appendix, but quite oblique, and the edges have not the same sloughy appearance which is seen at about an inch from the free extremity.—*Ibid.*, p. 145.

Arrest of Excessive Epistaxis.—Dr. D'Arcy relates a case of profuse bleeding from the nose, which, after trying all the ordinary modes, was arrested as follows:—A sheep having been killed, its œsophagus was ligated at one end, and introduced through the whole extent of the nostril. Water was then poured into it, the front end was also ligated, and compression made upon it with the hands until the pressure produced severe pain in the nares. It may be well to state that the common intestine used in sausage-making was tried previous to the œsophagus, but burst in the nostril.—*Ibid.*, p. 268.

Reduction of Inverted Uterus on the Sixteenth Day.—The inversion took place after the second labour of a healthy woman, 24 years old. Dr. Meldenhall saw her only the sixteenth day after, when he found her without pain. He placed her, lying on her back, under the influence of a mixture of chloroform and ether, and, while he carried the uterus upwards with the right hand, so as to put the organ and its connections on the stretch, he made counter-pressure against the outer edge of the organ by means of the left hand placed on the abdomen. "I am quite certain that this manipulation facilitated the reduction and added to the safety of the structures involved. The cramped position of the hand was relieved occasionally by passing a large rectum bougie, which was retained against the fundus by the hand in the vagina, so as to keep up pressure constantly. The turn of the uterus commenced at the neck, and was continued along the body until it involved the fundus. While this turning was in progress, the os could be felt enveloping successive portions of the body, until the fundus was also embraced by it. As soon as this portion was well above the os, the bougie was relied upon entirely to complete the reduction." The bougie was left in the uterus.—*American Journal of Med. Science*, October, p. 576.

Arsenic in Menorrhagia, Leucorrhœa, etc.—Dr. A. Burns is desirous of impressing his conviction upon the Profession of the great utility of arsenic in menorrhagia, leucorrhœa, hæmorrhage in threatened abortion and after delivery, and excessive lochial discharge. If called in during the hæmorrhage in menorrhagia, he gives from ten to twenty drops of Fowler's solution, according to the severity of the case, repeating it every twenty minutes. He has always arrested the hæmorrhage before the medicine has been pushed to a dangerous amount; and, indeed, care must be taken or it will entirely suspend the menstrual secretion. During the rest of the menstrual period, from five to ten drops are given three times a-day, and in the interval from three to five drops. In leucorrhœa he gives from three to five drops, until the cure is effected. Dr. Burns knows of no remedy so prompt in arresting hæmorrhage in threatened abortion, twenty drops usually being given at first, and then ten every twenty

minutes. It seems to suspend at once the contractions as well as the hæmorrhage. Given in the same way, it is as efficacious in *post-partum* hæmorrhage; and in cases of prolonged or excessive lochial discharge, given in doses of five to ten drops, in conjunction with tonics, it is very prompt in its effect.—*Ibid.*, p. 394.

Alcoholic Fluids in Tubercular Disease.—This formed the subject for the Fiske Prize Essay for 1859, adjudged by the Rhode Island Medical Society; and Dr. Bell, of New York, the successful essayist, sums up his memoir with these conclusions:—"1. The opinion so largely prevailing as to the effects of the use of alcoholic liquors, viz., that they have a marked influence in preventing the deposition of tubercle, is destitute of any solid foundation. 2. On the contrary, their use appears rather to predispose to tubercular deposition. 3. When tubercle already exists, alcohol has no obvious effect in modifying the usual course it takes. 4. Neither does it mitigate, in any considerable degree, the morbid effects of tubercle upon the system in any stage of the disease."—*Ibid.*, p. 436.

PROVINCIAL CORRESPONDENCE.

IRELAND.

DUBLIN, NOVEMBER 28, 1859.

THE first evening meeting of the 130th Annual Session of the Royal Dublin Society was held at the Society's House, Kildare-street, on Friday, November 25, the President of the College of Surgeons in the chair.

Dr. Robert McDonnell made a communication "On the Habits and Anatomy of the *Lepidosiren Annectens*." Dr. McDonnell, having commenced by stating that Dr. Carte, to whom he was indebted for the opportunity of anatomising a fine specimen of this animal which had lately died in the Zoological Gardens, had been associated with him in this investigation, entered upon a very detailed account of the habits of the *Lepidosiren Annectens* as observed in a specimen sent to him from Gambia by Francis Davis, Esq., R.N. This animal had arrived in the case of mud in which it had been taken up on the bank of its native river, and in which it had lived for some months. Dr. McDonnell directed attention to the habits of the animal with reference to its respiration, its mode of expiration, and its power of producing vocal sounds; also to its external rudimentary branchiæ, which, he ventured to say, would yet be found in the early state of development of the *lepidosiren* as naked gills. The presence of a pancreas was demonstrated as a glandular mass adherent to the posterior wall of the stomach and having ducts leading, with the liver duct, into the intestine immediately below the stomach.

Dr. McDonnell exhibited to the meeting the living *Lepidosiren Annectens*, its mud-case, and the slough-like covering which, in this case, had immediately enveloped the animal's body. Drawings also, as well as the preparations, were brought forward to show the existence of a pancreas and the condition of the external branchial filaments. The blood and scales of the animal were placed under microscopes for examination.

Mr. David Walker, late Surgeon on board the yacht *Fox*, in the Arctic Expedition, was introduced to the meeting, and read a paper entitled "Ice Observations." He said that the contradictory statements of Dr. Sutherland and Dr. Kane, with regard to the saltiness of the ice formed from sea-water—the former maintaining that sea-water ice contains about one-fourth of the salt of the original water; the latter, that if the cold be sufficiently intense, there will be formed from sea-water a fresh and purer element fit for domestic use—induced him to take advantage of his position, as naturalist to the expedition in the Northern seas, to re-investigate the subject. The changes which he observed sea-water to undergo in freezing are the following:—When the temperature falls below ≈ 28.5 deg. it becomes covered with a thin pellicle of ice; after some time this pellicle becomes thicker and presents a vertically striated structure, similar to that of the ordinary cakes of sal-ammoniac. As the ice further increases in thickness, it becomes more compact, but the lowest portion still

retains the striated structure. On the surface of the ice saline crystals, designated by the author "efflorescence," soon begin to form, at first few in number and widely separated, but gradually forming into tufts and ultimately covering the whole surface. At first the increase in thickness of the ice is rapid, but afterwards the rate of growth is much slower and more uniform. The ice formed yields, on being melted, a solution differing in specific gravity according to the temperature at the time of congelation, its density being less the lower the temperature at which the process of congelation took place. Although the author's observations extended from ≈ 28.5 deg. to -42 deg. he was never able to obtain fresh water from sea-ice, the purest specimen being of specific gravity 1.005, and affording abundant evidence of the presence of salts, especially of chloride of sodium, in such quantity as to render it unfit for domestic purposes. The efflorescence already referred to, appeared sooner or later, according to the temperature of the air, but generally commenced when the ice was $\frac{3}{8}$ of an inch thick, and continued to form till the ice attained a thickness of about nine inches, when, in consequence of the compactness of the frozen mass, it ceased to appear at the surface. The lower the temperature at which the ice was formed, the more abundant was the efflorescence. Direct experiments made by freezing sea-water in a large tub, showed that the unfrozen residuum contained a considerable portion of salts expressed from the ice. The author, therefore, infers that after the efflorescence had ceased to form on the surface, the saline particles were precipitated into the unfrozen liquid below.

The first meeting of the Pathological Society of Dublin for the Session of 1859-60, was held in the Anatomical Theatre of Trinity College, on Saturday, November 26, Dr. Law, President, in the Chair. Communications having been made by Drs. Hudson and M'Clintock, the President announced the subject selected for the Society's gold medal to be adjudicated at the termination of the Session—viz. "The Diagnosis and Pathology of Diseases of the Brain and its Membranes." The Society next proceeded to the election of Officers and Council for the year ending November, 1860, when the following were chosen:—*President:* Thomas Beatty. *Vice-Presidents:* Cathcart Lees, Robert Mayne, Joseph O'Ferrall, Benjamin G. M'Dowd, Fleetwood Churchill, and Samuel Gordon. *Council:* Robert Adams, John Banks, Dominick J. Corrigan, Christopher Fleming, John Hamilton, James S. Hughes, Edward Hutton, Robert Law, Sir Henry Marsh, Bart., Alfred H. M'Clintock, Josias Smyly, and Jolliffe Tufnell. *Honorary Secretary:* William Stokes. *Secretary and Treasurer:* Robert W. Smith. *Secretary for Foreign Correspondence:* Robert D. Lyons.

At a large meeting of the Medical Profession of Portsmouth and its neighbourhood, held on November 17, it was determined to form a Society called "The Portsmouth, Portsea, and Gosport Medical Registration Association," and the following officers were elected for the ensuing year:—*The Mayor of Portsmouth, W. H. Garrington, Esq., President;* Richard White, Esq., and Samuel Irvine, M.D., *Vice-Presidents;* George J. Scale, Esq., *Hon. Treasurer;* and James Greetham, Esq., *Hon. Secretary.* The meeting then adjourned until December 1, when rules and bye-laws were adopted similar to those of the London Association, with which this Society intends affiliating itself. More than fifty members have already joined the Society.

PROFESSOR A. VON GRAEFE'S OPHTHALMOLOGICAL CLINIK AT BERLIN.—This is by far the largest Ophthalmological establishment in existence, as besides several thousand out-door patients, above 100 beds are made up. Certainly, if diseases of the eye are not well taught there, it will not be from want of lecturing upon them, as may be seen from the following programme for the Session 1859-60:—1. Optics, Dr. Liebereich; 2. Introduction to the Microscopical Examination of the Eye, Dr. Schweiger. 3. On the Diseases of the Eye, Professor A. von Graefe. 4. "Propädeutische" Clinic of Diseases of the Eye, Dr. Michaelis. 5. Private Clinic of Diseases of the Eye, Professor A. von Graefe. 6. Private Ophthalmoscopic Practice, Dr. Liebereich. 7. Private Exercises on the Functions of the Eye, Dr. Liebereich. 8. Recapitulations of the entire subject of Eye Diseases, Dr. Michaelis. 9. Private Lectures on Operations, with practice on the Phantom and Dead Body, by Professor A. von Graefe. 10. Private Course of Operations on the Eye, Dr. Schuft.

REPORTS OF SOCIETIES.

THE PATHOLOGICAL SOCIETY.

TUESDAY, DECEMBER 6.

MR. FERGUSON, President, in the Chair.

MR. HARVEY exhibited specimens of

GOUTY DEPOSIT IN THE OSSICLES OF THE EAR.
This patient had had attacks of gout in the extremities, and also distinct gouty affection of the ear, with deafness. There were also deposits in the helix on both sides.

MR. HENRY THOMPSON exhibited for Dr. DAVIS a case of

SUPPOSED EPITHELIOMA OF THE TONGUE.

It was taken from a patient, aged 79. It was said to have existed for sixteen years, and had been six years under observation. It involved the tip and right half of the tongue. The left side of the tongue, the pharynx and larynx were atrophied. There had been great pain and difficulty in swallowing. No narcotic seemed to relieve the pain, and he would not submit to an operation. He died; and at the autopsy no malignant disease was found elsewhere. The glands were not affected.

MR. FERGUSON said that in cases of cancer of the tongue the pain in swallowing was usually entirely relieved by the removal of the disease, and thus, though it might return, great relief was afforded.

Doubts having been expressed as to the malignant nature of the growth in this instance, Dr. Bristowe and Mr. Hutchinson were appointed to examine it.

Dr. BUDD then brought forward a large

CANCEROUS TUMOUR.

It was taken from the anterior mediastinum. It filled the whole of this space, and extended into the neck. Through its substance passed all the large blood-vessels and also the great nervous trunks, the phrenic, recurrent, and the vagi. The patient from whom it was taken, was admitted into King's College Hospital with urgent dyspnoea, swelling of the face, and enlargement of the veins over the chest. There was also hoarseness, the voice not being above a whisper. She coughed up much puriform mucous. It was remarkable that in this case the nutrition of the lung was not much interfered with by the pressure of the tumour.

MR. CHRISTOPHER HEATH showed

A CYST SIMULATING A FEMORAL HERNIA,

removed from a woman aged 70, who suffered for some days from constipation, vomiting, and pain in the abdomen, complicated by the presence of an apparently strangulated hernia of small size in the left groin. An operation being considered necessary, the sac was exposed, and the stricture divided without opening the sac, but the symptoms continued, and the patient died. On examination evidences of enteritis were found, but no hernia, the tumour having consisted of a cyst, shut off from the peritoneum, and containing appendices epiploicæ derived from the large intestine, which passed into the pelvis in close proximity to the femoral ring, instead of in its usual position at the side of the sacrum.

Dr. JOHNSON exhibited a

TUMOUR FROM THE ANTERIOR MEDIASTINUM.

It weighed about a pound and a-half, and it was doubtful whether it was cancer or not. The subject was a patient, aged 84, in King's College Hospital. On admission, on November 5th, she was at first supposed to be labouring under typhoid fever. He had pain in the abdomen, with vomiting. On the 29th of November his urine was found to contain blood. It had been examined the day before, and was found to be then free from albumen. The kidneys were very much enlarged, and in each were about twenty circumscribed deposits, and in the centre of these was a hæmorrhagic patch. Under the microscope the deposit was found to consist of small cells, rather less than pus-cells, and not showing the same reaction on the use of acetic acid. Nowhere in the

tumour could cells be found at all resembling those usually considered cancerous. Dr. Johnson referred to a specimen on which Dr. Evans and Dr. Bristowe had formerly reported. The other parts of the kidney were apparently healthy. The tissues in the chest presented the same microscopical appearances as the deposit in the kidneys. Dr. Johnson requested that Dr. Bristowe might be appointed to examine and report upon the specimen.

Dr. Bristowe, in reply, stated that he should be very happy to make a further examination, if Dr. Johnson wished it. He had, however, since his report on the subject to which Dr. Johnson had alluded, made many examinations of similar specimens, and had found them to coincide with the character then given. He believed that in a large majority of specimens of medullary cancer, the microscopic characters resembled those described by Dr. Johnson, and that these tumours generally consisted almost wholly of nuclei.

Mr. TOYNBEE exhibited a specimen relating to a case of

ABCESS IN THE BRAIN FROM DISEASED EAR.

The patient, an old man, had for long been the subject of a molluscous tumour in one ear. The tumour had induced ulceration of the petrous portion of the temporal bone, and destroyed the tympanic cavity. Secondary abscess in the brain had resulted. The abscess, the size of a pigeon's egg, was situated in the middle lobe of the cerebral hemisphere. Mr. Toynbee remarked that the case supported the opinion that disease of the brain might be induced by any source of irritation propagated from the ear.

Mr. TOYNBEE also showed a specimen of

OSSEOUS STRICTURE OF THE EUSTACHIAN TUBE.

It was the second specimen only of this affection which had fallen under his observation. The patient died from serous apoplexy. The stricture was one-third of an inch in length, and involved the middle part of the tube, the part near the tympanum and the part at the commencement being free, and of the natural size.

Mr. TOYNBEE then showed other specimens of

DISEASE OF THE EAR,

among which was one of accumulation of cholesterine in the mastoid cells.

And exhibited a specimen of

EXOSTOSIS OF THE INCUS AND MALLEUS.

This was the only case of true exostosis in the ossicles of the ear that he had met with. The bones were welded together by the bony growth.

Dr. BRISTOWE then exhibited

A SUPRA-RENAL CAPSULE.

It was completely disorganised from tuberculoid deposit. The patient was 18 years of age, and had been ill four months. The symptoms had been vomiting and emaciation. There were no other marked symptoms: there was no bronzing of the skin. A careful examination was made of the other side, and no disease whatever was found. Dr. Bristowe remarked that the case was important and interesting, as confirmatory of Dr. Addison's views as to the importance of the supra-renal capsules. It also bore out the correctness of his description of the constitutional symptoms resulting from their disorganisation. Bronzing of the skin was the only symptom deficient.

Dr. BRISTOWE then brought forward a specimen of

FIBROUS DEPOSIT IN THE MUSCLES OF THE LARYNX.

Dr. BRISTOWE considered that this specimen was analogous to that of syphilitic tumours of the muscles of the scapula, which was exhibited some years ago. There had been in the present case slowly-increased difficulty of breathing, apparently from narrowing of the larynx.

Dr. BRISTOWE also showed a specimen of

VILLOUS CANCER OF THE STOMACH.

In reply to Mr. Henry Thompson, Dr. BRISTOWE stated that there was encephaloid cancer in the liver, and that he considered the specimen exhibited to be of the same nature, only assuming the villous character where it affected the mucous membrane.

Mr. SIDNEY JONES now brought forward specimens of

SYPHILITIC TUMOURS IN MUSCLES.

He considered that these tumours were deposits depending on syphilitic inflammation of the muscle. He alluded to a specimen of tumour of the muscle on the dorsum of the scapula which he had exhibited three years ago. In this case also there were isolated deposits in the latissimus dorsi and teres muscles, and those on the venter of the scapula. He had also seen such tumours in the sterno-mastoid and latissimus dorsi, and found that they yielded to the influence of the iodide of potassium. The specimens he showed were from a woman, aged 30, who had severe and well-marked symptoms of syphilis, caries and necrosis of the bones of the skull, periosteal nodes, etc. There was a tumour two or three inches in length in the triceps, and there was also necrosed bone in the neighbourhood; but this Mr. Sidney Jones did not think to be connected with the deposit. Tumours taken from other parts had no such apparent connexion.

Mr. SPENCER WELLS presented the pelvis of a woman who had died of

TETANUS AFTER PERINEAL SUTURE,

performed for the relief of Prolapsus Uteri with Cystocele and Rectocele. The symptoms in this case had pointed to injury of the perineal nerves, and increased reflex excitability of the spinal cord, as the cause of the tetanus; and Mr. Wells had been anxious, therefore, to have a minute examination made of the nerves implicated in the operation. Mr. Couper, Demonstrator of Anatomy at the London Hospital, had made the post mortem, had removed the whole of the pelvis, and had afterwards made a careful dissection. He stated, and the preparation exhibited showed, that neither the hypogastric plexus, nor any of the nerves given by it to the lower part of the bladder and rectum, afford any signs of inflammation. The sacral canal was laid open from behind, and the *cauda equina* and sacral nerves appeared healthy. Except in the vicinity of the united wound, and in the mucous coat of the bladder, there was no trace of inflammatory change in the pelvis. The mucous surface of the bladder was speckled with small blood-stains, grouped in patches, and apparently seated in the substance of the mucous membrane. The gastric mucous membrane was found in a similar state; owing probably to the fact that the woman had been for forty-eight hours before death almost constantly under chloroform.

This preparation also showed very distinctly

ROUGET'S UTERO-OVARIAN MUSCLE,

Mr. Couper having the credit of being the first to demonstrate it in this country. It was plainly seen to consist of bundles of muscular fibres, forming a fan-shaped muscle between the folds of the broad ligament, and showing that the uterus, the ovary, and the Fallopian tube, are enveloped in a common muscular membrane, and that the contraction of the bundles of muscular fibres would draw the ovary and the fimbriated extremity of the Fallopian tube together; and, by inclosing the venous plexuses near the ovary, would complete the erectile system of the female organs of generation so beautifully delineated by Dr. Savage, and explain very simply the mechanism of ovulation.

Mr. SPENCER WELLS then exhibited,

SIX OVARIAN CYSTS AND TUMOURS REMOVED BY OVARIOTOMY.

I. A *Fibrous and Cystic Tumour* removed from a married woman, 29 years of age. It weighed seven pounds and a-half, and consisted of a lower solid portion, simply fibrous in structure, and of a large cyst at the upper part, which had contained several pints of fluid. Portions of fibrine were adherent to its inner coat. The patient died forty hours after operation, and about six pints of clear serum were found in the right pleural cavity. A portion of the abdominal wall, including the incision, was also shown to illustrate the accuracy of union of the divided peritoneal edges of the wound, when these edges are folded together by passing metallic sutures through them.

II. A *multilocular Ovarian Cyst*, with masses of pseudo-colloid substance in its walls, successfully removed from a married woman, 47 years of age. In this case the pedicle was

on the right side, but the left Fallopian tube, having been found diseased and adherent to the cyst, was also removed. The patient is now in robust health.

III. *A multilocular Ovarian Cyst*, successfully removed from a married woman 41 years of age. The chief point of interest in this case was the fact that tetanus had appeared a fortnight after the operation, and the patient had recovered during the use of woorara. The case had been brought before the Medico-Chirurgical Society.

IV. *A multilocular Ovarian Cyst*, also successfully removed by ovariectomy from a single woman, 29 years of age. The cyst and contents had weighed fifty-four pounds. Most of the cysts were very small, but they had been broken down one after the other, and the whole removed through a four-inch incision. The convalescence of the patient had been delayed by a bed-sore, but she was now quite well.

V. *The Fallopian Tube and remains of the Peduncle of a multilocular Ovarian Cyst*, successfully removed from a young lady only seventeen years and three months old. The cyst and contents weighed thirty-eight pounds; but the whole had not been preserved on account of the difficulty of showing the numerous aggregations of small cysts of which it was composed. One point of interest in the case was, that the pedicle had been completely twisted round during the growth of the tumour. Mr. Wells alluded to a case in New York where such a twisting of the pedicle had led to strangulation, obstruction of the veins, and gangrene of the cyst, followed, of course, by the death of the patient.

VI. *A semi-solid Ovarian Tumour*, weighing eleven pounds and a-half, and two large cysts attached to it which had contained forty-one pounds of fluid, forming together a very large tumour of the right ovary, which Mr. Wells had removed from a single woman in the Samaritan Hospital, on the day of meeting. It was an unfavourable case, but one in which it was decided to give the patient the chance of a cure, as it was clear that life could not be prolonged very much, and it was not thought right to leave the woman to an inevitable and painful death, when there was even a moderate hope of recovery after operation. Mr. Wells had seen her just before the meeting, and she was then going on remarkably well.

Mr. WELLS added that he had now brought before the Society all the ovarian cysts and tumours of the cases in which he had performed ovariectomy. At the meeting of the Society of the 1st of November, he had shown a cyst removed four days before the meeting, and stated that the lady had gone on well since the operation. He had now to add that she continued to do well until the eighth day, when tetanus came on and she died two days afterwards. This case had been treated by woorara, and had also been brought before the Medico-Chirurgical Society. The general result of Mr. Wells's personal experience of ovariectomy in Hospital and private practice, had been nine recoveries and four deaths out of thirteen cases. The case last alluded to was the fourteenth.

WESTERN MEDICAL AND SURGICAL SOCIETY.

NOVEMBER 4, 1859.

A. B. BARNES, Esq., President, in the Chair.

A Paper by Dr. FULLER was read,

ON CERTAIN POINTS CONNECTED WITH THE TREATMENT OF RENAL ANASARCA.

The points Dr. Fuller selected as the subject of his paper were: 1st. The cause of the epileptiform seizures and other head symptoms which arise during the progress of renal disease, together with the best mode of obviating them; 2nd, The propriety of employing ferruginous preparations and renal stimulants in certain forms and at certain stages of renal disorder. Dr. Fuller observed, in regard to the first point, that although the head symptoms are commonly supposed to be referable to the non-excretion of urea by the kidneys, and to its consequent accumulation in the blood, many facts conduce to the belief that the mere existence of urea in the blood is quite inadequate to their production. Amongst the

facts cited in proof of this position may be mentioned the frequency of head symptoms in cases of acute renal mischief, marked during life by extremely albuminous or even bloody urine, and characterised after death by the large smooth mottled kidney; cases in which the urine is seldom of very low specific gravity, and in which a considerable amount of urea is excreted; and on the other hand the great length of time, the long series of years, during which patients suffering from the small, dwindled granular kidney, whose urine ranges from 1002 to 1008, will go on with their intellects unimpaired and their nervous system undisturbed, in spite of the extreme scantiness of the excretion of urea. Dr. Fuller mentioned the case of one such patient whom he had had under observation at intervals during the last fourteen years, the specific gravity of whose urine throughout that period had never exceeded 1007, and usually averaged 1004. The urine was not particularly abundant, and the quantity of urea excreted was very small, yet the man, though languid and unequal to long-continued bodily exertion, had never suffered in the slightest degree from disturbance of his sensorial functions. Another fact which seems to point to some sudden and temporary alteration in the condition of the blood—some decomposition of the urea long existing in the blood, or some other unusual chemical change—as the cause of the convulsions and insensibility, is the suddenness with which these symptoms arise, and the speed with which they pass off; until a few hours before the attack there is usually nothing in the general appearance of the patient or in the condition of his urine to indicate a change for the worse; and when the symptoms pass off, which they usually do in a short space of time, there is no observable improvement in the general symptoms; no appreciable alteration in the condition of the urine. Nevertheless, Dr. Fuller drew attention to the fact that head symptoms are especially prone to arise when the patient is unduly lowered or depressed, and he urged the necessity for extreme jealousy in maintaining as healthy a condition of blood as possible, by regulating the supply of food, by enforcing exercise, encouraging the action of the skin, and in every way providing for the elimination of the effete materials of the body by a more than ordinary demand on the activity of the excretory organs; and further in avoiding all measures, whether dietetic, medicinal, or otherwise, calculated to exhaust or unduly depress the nervous centres. With a view to guard against this condition, Dr. Fuller urged the expediency of maintaining a proper tone of the system by the cautious exhibition of diffusible stimulants, and by the occasional administration, for a lengthened period, of small doses of iron in a light bitter infusion. In respect to the administration of direct renal stimulants, Dr. Fuller combatted the opinion so often propounded, that when the kidneys are diseased our aim should be to avoid stimulating them, and to prescribe such remedies only as will increase the action of the other excretory organs. Observation, he said, had long since convinced him that the practice founded on this opinion is extremely inefficacious; and he maintained that the use of vapour-baths, diaphoretics, and purgatives, to the exclusion of diuretics and direct renal stimulants, is as false in theory as it is unsatisfactory in its practical results. He drew attention to the fact that Bright's disease is confined to persons in weakened health, and is essentially a disease of malnutrition, characterised by general anæmia, and by low congestion of the kidneys, rather than by active inflammation. Therefore, on the same principle as that on which stimulating applications are employed to relieve congested conditions of the throat, languid ulcers, scrofulous eyelids, and other seats of diseased action characterised by low congestion and malnutrition, he insisted that in these cases of renal malnutrition and passive congestion renal stimulants, such as cantharides and turpentine, should be employed, in conjunction with saline purgatives, vegetable bitters, iron, and whatever may be necessary to improve the general health. He acknowledged that, in cases of renal mischief, marked by acute desquamation of the uriniferous tubes, the propriety of such treatment admitted of doubt, and that the warm bath, dry cupping to the loins, and the exhibition of digitalis and brisk purgatives, generally prove more serviceable; but he cited cases to prove that even when desquamation is proceeding actively, as it does in most instances of scarlatinal dropsy, long after the feverish symptoms have subsided, the exhibition of iron and the tincture of cantharides is often followed by the happiest results.

FRIDAY, NOVEMBER 18.

Dr. FINCHAM, Vice-President, in the Chair.

ON A CASE OF ANGINA PECTORIS, WITH
OSSIFICATION OF THE ANTERIOR CORONARY
ARTERY.

The history, treatment, and fatal termination of this interesting case were first detailed at length, and the post-mortem appearances then given in full, accompanied with remarks upon their import. The principal points were:—A gentleman, aged 57, of a robust form and apparently in good health, had suffered for some time from difficulty of breathing on walking quick. In January last, he was suddenly attacked with pain beneath the left clavicle; dyspnoea; great anxiety; a disposition to faint, with paleness of countenance. He recovered after stimulants had been administered, and mustard poultices applied to his chest. A succeeding paroxysm of greater severity followed in two or three hours, which was again successfully treated. The author was called to his patient again in September, when the same and other remedies were ineffectual. A post-mortem examination revealed an ossified condition of the anterior coronary artery, obstructing it almost two-thirds down. The cavities of the heart were greatly dilated, and the walls much enlarged. The muscular portion of its valves was thickened. There was stertomatous and bony deposit under the lining membrane of the aorta.

Dr. ANSTIE exhibited a specimen of

TUBERCULOUS ULCERATION OF THE LARYNX
AND TRACHEA.

It was taken from a patient who entered the Westminster Hospital with symptoms of phthisis, accompanied with loss of voice, difficulty of deglutition, and other symptoms of ulceration of the larynx. She died about seven weeks after admission. The history of the case was remarkable from her having been attacked only eight months previously with the throat symptoms, no suspicion of chest disease being then entertained. The post-mortem examination discovered extensive deposit of miliary tubercles in the lungs, and ulceration of the larynx and trachea. The vocal cord of the left side was found completely destroyed, and the thyroid and arytenoid cartilages laid bare. The trachea, for two and a-half inches below the larynx, had patches of ulceration, exposing the tracheal cartilage. The epiglottis was unaffected.

Mr. T. DICKINSON exhibited a specimen of

PERFORATING ULCER OF THE STOMACH.

It occupied the anterior surface, near the lesser curvature. The man had been ill twenty-four hours, but was not seen until after death. There had been no vomiting, and comparatively little pain.

Mr. PRESCOTT HEWITT then related three cases which had come under his notice within a fortnight—of children who, presenting themselves with a discharge from the nostrils, foreign bodies were discovered impacted in them. In one a long screw, in another a button, and in the third some wood shavings were extracted. The symptoms in one case had existed three years, and in all they had been treated for ozena.

THE HARVEIAN SOCIETY.

THURSDAY, DECEMBER 1.

Dr. HART VINEN, President, in the Chair.

A Paper by Mr. HARRY LOBB was read upon

THE PATHOLOGY AND TREATMENT OF IDIO-
PATHIC PERIPHERAL NEURALGIA.

He commenced by dividing neuralgia into:—1. Central; 2. Peripheral; and 3. Reflected. Of the Central, arising from disease of the brain or spinal cord, he did not speak. The second he divided into idiopathic, traumatic, and neuro-matous. The third—Reflected—he proposed considering in a future paper. Idiopathic peripheral neuralgia was described as a stabbing, darting pain, referred to the course of a nerve,

shooting down the nerve like lightning, coming on suddenly, lasting but a moment, and repeated at intervals; the pain is so acute as to be unendurable if continuous. The part or limb affected by this form of neuralgia is colder, and the skin supplied by the neuralgic nerve is numb more or less; not tender to the touch, the patient liking to be rubbed—frequently grasping the part with the hands and pressing it; if the neuralgia has lasted any time, there is more or less paralysis in the muscles supplied by the accompanying motor nerve. The author then gave his views at some length upon the generation and distribution of nerve force from the capillary circulation, in order to make his description of the pathology of this form of neuralgia intelligible. He described a sentient nerve as a conductor to the brain of sensation taking place at the periphery. Neuralgia is not, therefore, hyperæsthesia of healthy function. During health a nerve has no sensation proper in itself; if you strike it, or cut or tear it, the sensation is referred to the parts to which it is distributed, but in this form of neuralgia it is the nerve itself to which the pain is referred as darting up and down its course. Mr. Lobb then likened a sentient nerve to an iron conducting-wire of a galvanic battery, which of a certain uniform diameter conducts a given quantity of galvanism without being perceptibly affected by its passage; but if a portion of the wire be much finer than the rest it becomes red hot, being unable to conduct the whole of the galvanism, the remainder correlating into heat. So in a nerve, if by mal-nutrition it is unable to conduct normal sensations to the brain, the nerve current, by affecting the polarity of the nerve itself, gives the idea of pain in that portion of the trunk of the nerve, its peripheric terminations at the same time being numbed. The author considered the indications for treatment, therefore, to be increased and healthy circulation, arterial and nervous. After enumerating the usual methods of treatment, he considered the only agent capable of carrying out these indications to be the continuous galvanic current; and he recommended, as the only apparatus that can be worn upon the surface and capable of generating a sustained current, the Pulvermacher chain, producing a continuous current of galvanic electricity in one uniform direction, mild, yet sufficiently energetic for Medical purposes. Mr. Lobb then described the method of applying the chain, and exhibited some experiments with its aid,—as the decomposition of water, contractions of muscles, etc. In the treatment of idiopathic peripheral neuralgia he looked upon the Pulvermacher chain as a specific. Immediately upon adapting the excited chain to the part, a genial and peculiar glow is felt, not mere warmth, but a sense of vitality in the part; the patient is aware of a life-giving agent, and immediately says that he is relieved; the neuralgia disappears, and sensitiveness of the surface returns. The paper concluded with several interesting cases in which the continuous galvanic current afforded rapid and permanent relief.

OBITUARY.

DR. WILLIAM ROOTS, OF KINGSTON.

It is our painful duty to record the death of the above respected gentleman, which took place at Kingston on the 2nd inst., in the eighty-fourth year of his age. The regret which will be deeply, and we may add, universally felt at his loss, will be long remembered by those who were the witnesses of his public usefulness and his private worth. During the active pursuit of his Profession for upwards of half-a-century, during his connexion with the Corporation of this Borough, and during the comparative retirement of his later years, his character and his acts, alike useful and honourable, have secured for his memory the gratitude of many, the esteem and respect of all. This noble legacy of a good man and a good citizen will, we are assured, be not lightly valued, but affectionately preserved by his friends and Professional brethren.

Dr. Roots was one of the oldest and most respected members of our Profession. His college diploma dated 1801. He was held in deserved regard for the high tone of his Professional conduct. He was gifted with varied conversational powers, and his reminiscences of the "great ones of the past"—as he had been a pupil of John Hunter—always rendered his company both attractive and instructive.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS.—The following gentlemen, having undergone the necessary examinations for the diploma, were admitted members of the College, at a meeting of the Court of Examiners on the 2nd inst. :—

Anderson, Alfred, Manchester
Blackburn, John, Barnsley, Yorkshire
Drury, John Thomas Cockin, Doncaster
Edye, Stonard, Exeter
Fox, Allan Nesbitt, Dublin
Godwin, Charles Henry Young, Bishopstoke, Hants
Heslop, Arthur, Kirkby-Stephen, Westmoreland
Knight, Thomas, Brill, Bucks
Lane, William Beamish, Arlanstown, Kinsale, Cork
Mitchell, Thomas Carter, Bedford
Morgan, Cosby William, Brisbane, Australia
Smyth, Brice, Dublin
Thompson, Herbert, Westerham, Kent
Winkfield, Alfred, Bedford

The following gentlemen, having undergone the necessary Examination for the Diploma, were admitted Members of the College at a meeting of the Court of Examiners on the 5th inst. :—

Addison, William John, Wigton, Cumberland
Atwell, George Haines, Campden-hill-villas, Kensington
Bennett, George John, Gateshead
Bernard, John Celestin, Trinidad, West Indies
Bowen, David, Haverfordwest
Cook, John, Kentish-town
Copp, Henry Burton Peard, Kimbolton-road, Bedford
Dawson, George, Bishop Auckland
Dickins, Frederick Victor, Manchester
Franks, John, Sevenoaks, Kent
Freeman, William, Maldon, Essex
Greenwood, Newton, Turo, Cornwall
Hornblow, William Robert, Shipston-on-Stour, Worcestershire
Horton, Henry James, Fulham
Hunt, Thomas, Alfred-place, Bedford-square
Kitchener, Thomas, Trinity-square, Borough
Mayan, Gorge, Monmouth
Mawley, Augustus, Gower-street, Bedford-square
Sheldon, Thomas, Stratford-on-Avon
Simmons, Benjamin, Hatfield, near Doncaster
Smith, William, Aberdeen
Terry, Joseph Garside, Westerham, Kent
Williams, Robert, Liverpool
Wilson, Jacob Affrati, Sydney, Australia
Woodhead, William Copley, York

At the same meeting of the Court, the following gentlemen also passed their Examinations for Naval Surgeons; they had previously been admitted Members of the College, their diplomas bearing dates respectively the 9th of August, 1852, and the 28th of October, 1853 :—

Eustace, Richard, Haslar Hospital
Ryan, Edward Tenison, Her Majesty's ship "Pembroke"

APOTHECARIES' HALL.—Names of gentlemen who passed their First Examination, on Thursday, the 1st December :—

Bowstead, Rowland Mounsey, Caistor, Lincolnshire
Orton, Theodore, Littlebourn, Kent

UNIVERSITY OF LONDON.—Bachelor of Medicine, 1859.—The following gentlemen have passed their Examination for Honours :—

PHYSIOLOGY AND COMPARATIVE ANATOMY.
Crowfoot, W. M. (University Medical Scholarship and Gold Medal), St. Bartholomew's Hospital
Gasquet, Joseph Raymond (Gold Medal), University College
Thompson, Edmund Symes, King's College
Moxon, Walter, Guy's Hospital
Robbs, William Edward, King's College

SURGERY.
Crowfoot, W. M. (University Medical Scholarship and Gold Medal), St. Bartholomew's Hospital
Hill, Matthew Berkeley (Gold Medal), University College
Thompson, Edmund Symes, King's College
Moxon, Walter, Guy's Hospital
Marriott, Charles Hayes, University College
Jones, Philip Sydney, University College } Equal.
Liddon, William, King's College

MEDICINE.
Thompson, E. S. (University Medical Scholarship and Gold Medal), King's College
Robbs, William Edward (Gold Medal), King's College
Gasquet, Joseph Raymond, University College } Equal.
Marriott, Charles Hayes, University College
Moxon, Walter, Guy's Hospital
Jones, Philip Sydney, University College
Hill, Matthew Berkeley, University College
Crowfoot, William Miller, St. Bartholomew's Hospital

MIDWIFERY.

Crowfoot, William Miller (Gold Medal), St. Bartholomew's Hospital
Jones, Philip Sydney, University College
Thompson, Edmund Symes, King's College
Moxon, Walter, Guy's Hospital
Robbs, William Edward, King's College

The following gentlemen also passed the M.D. Examination :—

FIRST DIVISION.

Carpenter, Alfred, St. Thomas's Hospital
Cousins, John Ward, St. Thomas's Hospital
Down, John Langdon Haydon, London Hospital
Foster, Michael, B.A., University College
Giles, Samuel, B.A., Guy's Hospital
Hardwick, Robert George, Leeds School of Medicine
Lawrence, George William, King's College
Lewis, Thomas, University College
Meeres, Edward Evan, King's College
Newman, William, St. Bartholomew's Hospital
Wilkinson, Richard, King's College.

APPOINTMENTS.

BENNETT—PAGE.—On December 7, Dr. R. Bennett and Dr. Page were elected Consiliarii of the College of Physicians of London, in the place of Sir J. Forbes and Dr. Sutherland, resigned.

BRIGHT.—On December 1, Mr. John Meaburn Bright was elected Resident Medical Officer of the Guildford Dispensary.

POWER.—On December 1, Henry Power, F.R.C.S., M.B. Lond., as Surgeon to the Royal Westminster Ophthalmic Hospital.

ROUSE.—On December 1, Mr. James Rouse as Assistant-Surgeon to the Royal Westminster Ophthalmic Hospital.

DEATHS.

ANDREW.—December 1, at 15, Queen-street, Edinburgh, Dr. James Andrew, Cantab., F.R.C.P., F.R.S.E.

DOUGHTY.—November 25, at Greenheys, Manchester, William Doughty, formerly of Kidderminster, Surgeon, aged 78.

FLETCHER.—December 2, at 39, Upper Gower-street, Bedford-square, John William Fletcher, late of the Bengal Medical Service, aged 41.

MACFIE.—November 29, at Albany-place, Dumfries, William Henry Macfie, M.D., formerly Surgeon to the 9th Regiment Turkish Contingent, late of Great Brunswick-street, Dublin.

MINER.—November 16, at New York, William Miner, M.D., aged 44.

PESKETT.—December 2, at Yarmouth, Isle of Wight, after only a few days' illness, Henry Peskett, M.D., late of Petersfield, Hants.

SALMON.—Recently, Surgeon-Major E. Salmon, late of the Scots Fusilier Guards.

SUCH.—November 29, at 19, Euston-road, Edwin John Such, late of Islington, Surgeon, aged 43.

TRENCH.—December 1, at 16, St. James's-square, Notting-hill, John P. Trench, Staff-Surgeon to the Forces, aged 40.

TURNER.—Recently, in Scotland, William Turner, Surgeon, R.N. (1897.)

THE cholera having disappeared at Algesiras, clean bills of health are now issued there.

DR. BACHHOFFNER states that the number of illegitimate children born in Marylebone, in and out of the workhouse, during the past five years, was 1937; and that of these 843 were born in the workhouse.

THE EMPEROR OF RUSSIA has ordered that in the Military Hospital at Moscow one hundred beds shall be placed at the disposal of Dr. Kreyser, for the treatment of patients exclusively on hydropathic principles.

THE NEW ARMY MEDICAL SCHOOL.—Mr. Tufnell, Professor of Military Surgery in Dublin, objects to the proposed Central School, and recommends the appointment of local Professors at each of the principal Medical Schools.

THE PURITY OF GLYCERINE may be tested by dropping into a glass of it a few drops of nitrate of silver. If, as is often the case, the glycerine contains any chlorides, there will immediately take place a cheesy precipitate.—*Bull. Thé.*

DR. GILLETTE, Physician of the Hôpital des Enfants, died lately from diphtheritic angina, contracted in the practice of his art. He is, we believe, the fourth victim of the Medical Body sacrificed, in a short period, through the contagion of this dreadful disease.

BRUTE INSTINCT AND HUMAN WIT.—Dr. Hooker, in describing the ascent of the Himalayas, says, that the natives, in making their paths, despise all zig-zags (like the ancient Romans by the way), and run in straight lines up the steepest hill faces; while "the elephant's path is an excellent specimen of engineering—the opposite of the native track—for it winds judiciously."

THE French have their failures in ornamental art as well as ourselves. They speak now of "that frightful bronze

caricature which, as a work of art, so cruelly dishonours the Court of the Faculty of Medicine of Paris, and which has the ill-founded pretension of representing the illustrious author of 'Researches on Life and Death.'

"IN the returns of 108 Coroners' Inquests, held in Ceylon during five years, from 1849 to 1855, in cases of deaths occasioned by wild animals, 16 are recorded as having been caused by elephants, 15 by buffaloes, 6 by crocodiles, 2 by boars, 1 by a bear, and 68 by serpents—the great majority of the last class of sufferers being women and children who had been bitten during the night."

OXFORD EXAMINATION FOR HONOURS.—Chemistry: Henry Charlton Bastian (prize of books), University College; William Crosby Barlow, Hackney Theological Seminary; Matthew Henry Starling, King's College. Animal Physiology: Henry Charlton Bastian (prize of books), University College; Julian Goldsmid, University College; Robert Henry Roberts, Baptist College, Bristol. Vegetable Physiology and Structural Botany: Henry Charlton Bastian (prize of books), University College.

A NEW IDEA.—Dr. Foussagrives, amongst other conclusions concerning tartar emetic, has arrived at this one:—That in large doses it generally arrests the acute accidents of tuberculous softening in the lungs, and maintains or brings back the consumption to that condition in which mineral waters and fish oils are so successfully used. The existence of signs of softening of the stomach (what is this disease, and what are its signs?) constitutes the only contra-indication to the use of the tartar emetic.—*Bull. Thé.*

"SUCH is Homœopathy. It is not a system, and hardly can it be called a method. It is really nothing but a combination of hypotheses borrowed from different systems, an attempted innovation, in which the influence of metaphysics and mystic spiritualism is mingled; the marvellous plays a part in it, and a large part also belongs to the supernatural, to the invisible, to the mysterious—to all those things which can seduce feeble or ill-enlightened minds."—*Revue des deux Mondes.*

WATER CURES.—In Argentine America the people still believe in the conservative powers of sarsaparilla, and in consequence a crowd of patients journey to the Rio Negro for the sole purpose of taking baths in the stream and drinking its waters which have bathed the roots of the sarsaparilla plant. On the other hand very different properties are attributed to a fountain of Cavacurta, in Lombardy, by the inhabitants. The young people around are accustomed to drink its waters about the period of the conscriptions, fifteen days before the day of drawing lots, and thereby catch a gôitre to exempt them from military service.

SIR E. TENNENT, speaking of the practice of a native doctor of Ceylon, says that when his house was searched, in consequence of the Report that a number of dead children were secreted there, "there was a volume of receipts for compounding nefarious preparations and poisons, and along with these a manuscript book, containing the necessary diagrams and forms of invocation to 'Siva the Destroyer' for every imaginary purpose,—to seduce the affections of a female, to effect a separation between a husband and wife, to procure abortion, to possess with a devil, to afflict with sickness, and innumerable directions for procuring the death of an enemy." In this remarkable Treatise on Domestic Medicine there was not a single receipt for the cure of disease.

WINTER LECTURERS AT THE PARIS FACULTY OF MEDICINE.—The following are the names of the various Professors at the Faculty for the Session commencing Nov. 15:—Medical Physics, Gavarret; Medical Pathology, Guillot; Operations and Apparatus, Malgaigne; Medical Chemistry, Wurtz; General Pathology and Therapeutics, Lasègue, in place of Andral; Surgical Pathology, Denonvilliers; Clinical Medicine, Bouilland, Piorry, Rostan, and Trousseau; Clinical Surgery, Laugier, Jobert, Velpeau, and Nélaton; Clinical Midwifery, Paul Dubois.

THE ALLEGED SALE OF MEDICAL DIPLOMAS.—In reference to the statement which appeared in this journal, October 8th, the editor of the *Boston Medical and Surgical Journal* says:—"We can assure the *Times and Gazette*, that there is not the least danger that any University or Medical School in America

would sanction such transactions. Either the letter is a most absurd hoax, or, what is more likely, is the production of an insane man. There is no 'Latin Secretary' in any University or College in America to our knowledge; and there is no such place as Clarksville, in Cayuga County, N. Y. We do not believe it possible for a diploma (other than an honorary one) to be given by any American College to a person who has not attended the lectures, and submitted to the examinations of all the Professors who sign it."

UNDER the head of Experimental Pathology, Beckmann has published the following details. As regards albumen in the urine as a consequence of increased pressure in the arterial system, he tied the abdominal aorta of a dog an inch below the renal arteries, but never could find albumen in the urine for a month, during which time the animal was under observation. In another experiment he tied both crural arteries, and still found no trace of albumen in the urine. In a further series of experiments, Beckmann observed hypertrophy of the heart as a consequence of ligature of one ureter, and after ligature of the aorta. The kidney whose ureter was tied was found atrophied at the end of four months, the urine never having presented the slightest change in constitution.—*Gaz. Méd.*

IN SCOTLAND, during the last (Registrar-General's) quarter, we find that of the 26,003 births 2,304 were illegitimate, or about 8.8 per cent., the smallest per-centage 2.2, being in Sutherlandshire, and the largest, 19.2, in Kinrosshire. The proportion of illegitimate births in the town districts is 8.6, and in the country 9.1 per cent. Of the births registered 13,306 were males and 12,697 females, and of the deaths, 6785 were males and 6565 were females. The estimated increase of the population during the quarter is 8407 persons. The health of the population during the quarter has been on the whole very satisfactory; but scarlatina, sometimes accompanied by diphtheria, seems to have been alarmingly fatal in various parts of the country, and some cases of cholera were reported, chiefly in Caithnessshire. The weather report is chiefly remarkable as showing a great deficiency in the fall of rain.

DEATH DURING INHALATION OF SULPHURIC ETHER.—A woman, aged 27, came under the care of Dr. Alonzo Clark, at the Bellevue Hospital, suffering from intense and frequently-recurring headache, the pain being sometimes so intense as to cause her to scream and throw herself about. For the last four or five weeks there had been great unsteadiness of gait, and a disposition to roll out of bed, invariably towards the left side. Sulphuric ether was the only means which relieved her headache. This it did effectually; and it had been employed three times, two or three ounces being used each time, without ill effect. After having thus been three months in the Hospital, the ether was administered as before; and in a few minutes voluntary respiration ceased, and the countenance became somewhat livid, the pulse being rapid but tolerably strong. She was carried to the window, and artificial respiration was kept up during seven hours, various other means being also resorted to. The pulse remained perceptible for twenty minutes, and the countenance alternated between a livid and a brighter hue for several hours. At the autopsy, a tumour was found occupying the right lobe of the cerebellum. The blood was everywhere fluid and dark-coloured, and the veins of the head contained a notable quantity of air.—*Boston Medical Journal*, vol. lxi., p. 245.

CEYLON METALS.—In 1847, tin was ascertained to exist in the alluvium along the base of the mountains to the eastward, but so circumstanced that it cannot be extracted with advantage. Nickel and cobalt appear in small quantities in Saffragam, together with rutile and wolfram, which might find a market in China for the colouring of porcelain. Tellurium, another rare and valuable metal, hitherto only found in Transylvania and the Ural, has likewise been discovered on these mountains. Manganese is abundant, and there is a description of iron ore which is singularly fine; it is easily smelted, and so pure when reduced as to resemble silver. The rough ore produces on an average fifty per cent., and requires no puddling; when converted into steel it cuts like a diamond. "The metal," says Dr. Gygax, in his report to the Ceylon Government, "could be laid down in Colombo for £6 per ton, even supposing the ore to be brought thither for melting, and prepared with English coal; but anthracite

being found upon the spot, it could be used in the proportion of three to one of the British coal, and the cost correspondingly reduced." Rich veins of plumbago, molybdena, kaolin, adapted for the manufacture of porcelain, and nitre, are also known to exist in the island.

ROYAL INSTITUTION OF GREAT BRITAIN.—General Monthly Meeting, Monday, December 5, William Pole, Esq., M.A., F.R.S., Treasurer and Vice-President, in the Chair. Thomas Richard S. Andrews, Esq., George March Harrison, Esq., Andrew Halley Knight, Esq., Hon. Augustus Henry Vernon, Lachlan Mackintosh Rate, Esq., M.A., Alfred Smee, Esq., F.R.S., and William Swann, Esq., were duly elected members of the Royal Institution. The Secretary announced that the following arrangements had been made for the Lectures before Easter, 1860:—Six Lectures on the "Various Forces of Matter" (adapted to a juvenile auditory), by Professor Faraday, D.C.L., F.R.S., &c., Fullerian Professor of Chemistry, R.I. To be delivered in the Christmas Vacation, 1859-60. Twelve Lectures on "Fossil Birds and Reptiles," by Professor Owen. Twelve Lectures on "Light, Including its Higher Phenomena," by Professor Tyndall. Ten Lectures on the "Relations of the Animal Kingdom to the Industry of Man," by Dr. Edwin Lankester, M.D., F.R.S.

"SUGAR IN THE URINE," writes M. Henry Musset, "does not necessarily imply the existence of diabetes. One may pass sugar with the urine, and yet enjoy perfect health. Dr. Blot has shown that sugar exists normally in the urine of all women during parturition, of nurses, and of a certain number of women during pregnancy. Dr. Leudet has shown in paraplegic patients that there is a constant relation between the appearance of the nervous cerebral accidents and the glycosuria. Dr. Itzigsohn relates a remarkable case of traumatic diabetes, occurring in a blacksmith who had received a blow on the top of the head. Dr. Todd has also given a case of diabetes which was observed in a woman after she had received a blow on the head. Prout observed sugar in the urine of dyspeptics and aged persons, and Dr. Goolden in children during dentition. Thus, then, there are numerous circumstances, physiological and pathological, which, directly or indirectly, concur in the formation of sugar in the economy. Can we now, with M. Mialhe, explain the presence of the sugar in the urine, by the greater or less alkalinity of the blood, which in the latter case cannot transform the glucose—the glucose then becoming a foreign matter in the body, and so discharged by the kidneys? Or, with M. Bouchardat, shall we explain the glycosuria by supposing the presence of some peculiar principle, which has an action on starch like that of diastasis? Then, again, we have the explanation, resulting from discovery of the glycogenic function of the liver by M. Bernard, viz., that the function of this organ is impeded, and the sugar thrown into the general circulation. When, however, we consider, that in every body there are products which are returned by the lymphatics into the general circulation; that the transformation of starch goes on normally in the intestines; and that it is accomplished even in the mouth under the influence of the salivary diastasis; and if, moreover, we recollect—that glycosuria accompanies dentition, dyspepsia, certain cerebral disturbances, that it may be caused by irritation of the brain at the origin of the eighth pair of nerves; that it exists in pregnant and parturient women and nurses—are we not naturally brought to the conclusion, that diabetes is a neurosis troubling the harmony of the assimilating functions?"—*L'Union Méd.*

VITAL STATISTICS OF LONDON.

Week ending Saturday, December 3, 1859.

BIRTHS.

Births of Boys, 915; Girls, 912; Total, 1827.

Average of 10 corresponding weeks, 1849-58, 1608.7

DEATHS.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.741 in.
Mean temperature	37.3
Highest point of thermometer	48.0
Lowest point of thermometer	29.0
Mean dew-point temperature	34.1
General direction of wind	Variable
Whole amount of rain in the week	1.18
Amount of horizontal movement of air in the week	1468 miles.

TO CORRESPONDENTS.

In the First Volume of the

Medical Times and Gazette

For 1860,

A SERIES OF PAPERS WILL APPEAR

BY DR. CONOLLY,

ENTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE:

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,
SENILE INSANITY,
VARIETIES OF INSANITY WITH PARALYSIS,
UTERINE AND OVARIAN CASES,

With special relation to their Causes, as—

INTemperance,
UNSUITABLE STUDIES,
FANATICISM, ETC., ETC.

It is quite unnecessary to make a single remark upon the great interest of such a Series of Papers from so eminent a Physician, and so able a writer as Dr. CONOLLY.

Dr. SIMPSON's Twenty-fifth Lecture is in type, but the proof arrived too late for correction and insertion this week.

A Lecture by Dr. West on "Cerebral Symptoms independent of Cerebral Disease," will appear in an early number.

Dr. Adams's Letter on Foetal Auscultation is unavoidably delayed until next week.

Fair Play's letter on the Indian Medical Service shall appear next week.

Delta.—A translation by Dr. Squire, of Boudault's pamphlet on Pepsine, is sold for sixpence.

A Correspondent wishes to know where the Latin proverb, *Poeta nascitur non fit* is to be found.

No Sham.—No one who has not a degree of Doctor of Medicine can legally or honestly append the initials "M.D." to his name.

A. A. A.—"*Purus Medicus, Purus Asinus*," wrote a Physician of the last century, who considered that a man might be a good cobbler without sitting for ever on his stool.

J. D.—The letter of Mr. Laurence appears to be a private one. If so, it would not be right to publish it; but we should be glad to know if it be official or not, before returning to the subject next week.

A Constant Reader.—The right of Licentiates of the Royal College of Surgeons of Edinburgh to practise Medicine appears to have been yielded since the passing of the Medical Act, and the two Edinburgh Colleges now unite in giving the double qualification by a joint diploma.

S. R. T.—The payment for a practice varies very much according to its value, the period of introduction, and the class of patients. One year's purchase for a short introduction, or two years' purchase for a long introduction, with a certain share of profits during the period of introduction, is a common and fair arrangement.

E. B.—The publication of the letter respecting the Reverend Cancer-Curer and Mesmerist would expose both us and our Correspondent to an action for libel; but we think the case should be stated openly before a Magistrate at a Police Court. The Medical bearing of the case is so indirect that we should not be justified in taking it up.

W. C.—We are not aware whether or no "Dr. William Batchelour, Member of the Royal College of Surgeons of England, 1835, and Member and Licentiate of the Apothecaries' Company, 1834, Doctor of Medicine of Erlangen," really holds these diplomas. If so, he has violated his College oath not to deal in secret remedies, and the College have the remedy in their own hands.

ENGLISH SPELLING OF FRENCH NAMES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You three weeks ago gave an amusing account of the way in which a learned French author treats English names. A well known English Medical Journal lies before me, and I just dot down a couple of like frequent errors which met my eye in running through its pages,—Borden, Souberain. I am, &c.

Croydon, December 3, 1859.

T. M.

DR. ROOKE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Will you allow me to state for the information of my friends, who may feel surprised at my aspiring to municipal honours, that I am not the "Dr. Rooke" who, according to your last number, "has been elected an Alderman" (or rather Town Councillor), "of Scarborough after a severe contest." I am, &c.

Scarborough, December 3, 1859.

T. MORLEY ROOKE.

ACTION OF WOORARA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Your Paris correspondent tells us M. Bernard declares that "the action of Woorara is infinitely less marked when administered to the mutilated and suffering animal, than when given to the healthy and strong." I beg to subjoin the following, as proof of the comparatively inert action of poisons on animals severely mutilated. I some years ago administered about half-an-ounce of Scheele's hydrocyanic acid to a favourite setter, who had been run over by a Great-Western Railway train. The animal was brought home with the hinder part of its body completely smashed into a jelly-like mass; but it lay sensible and as alive in its intelligence as ever. On this animal the hydrocyanic acid had no apparent effect, and it was ultimately destroyed by strangulation. I am, &c.

Sic.

IRISH POOR-LAW COMMISSIONERS—THE MEDICAL REGISTRATION ACT.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—A vacancy having occurred for Medical Officers to a Dispensary two candidates offered themselves, the one registered the other not. The election took place and the votes were equal, which saved a "triumph to either party." The "registered" candidate naturally considered that his opponent was disqualified, and accordingly addressed the Poor-Law Commissioners on the subject, asking the question. The Commissioners in reply say "that there is nothing in the Medical Charities Act to prevent an unregistered practitioner from being put in nomination for the office of Medical Officer of a Dispensary district; but the 36th section of the Medical Registration Act disqualifies unregistered persons for the office in question" (1). If the commissioners, therefore, have a pet unqualified person elected, they will simply withhold their sanction to his election until they ascertain that he has registered, and thus oust a qualified man from an office by their dictum on the law. This is a question which should be at once settled by the Medical Council, or some competent authority. I am, &c.

November 30, 1859.

M. D.

THE DUDLEY SURGEONS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your leading article of December 3, you say that "the College of Surgeons not long ago admitted to a modified examination, and granted Diplomas of Surgery to, two applicants who had in no way complied with established regulations,—the one a Druggist, and the other a Surgeon's Assistant."

Up to the present time the Assistant only has been fortunate enough to obtain the Diploma, for since the protestation the Druggist has not been up for his examination, and I am informed that it was in consequence of a promise previously given to the Assistant's master, that he only has been the favoured one.

You will, perhaps, excuse me for setting you right upon the facts, though they so little affect the question at issue. If Medical Registration Associations are formed for the protection of their Members under the Medical Act, is it not a little curious that the prime movers in this untoward step of the College should be gentlemen most intimately connected with the management of the Association in Birmingham? Dec. 6, 1859. I am, &c.

M. R. C. S. E.

POOR-LAW MEDICAL REFORM ASSOCIATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Mr. Richard Griffin seems to have forgotten that my inquiries concerning the so-called "Poor-Law Medical Reform Association" were addressed to you, and not to him; and as you are in possession of my real name, there is no reason why "Mr. Paul Jones must be classified under the head of anonymous communications," as Mr. Griffin so queerly expresses it.

In his reply to you he states that he is Chairman, Treasurer, and conducts the correspondence; (i.e. Secretary) that there is a committee of

thirty-four, who can seldom meet, but with whom he has "had frequent communication." He does not tell us what constitutes membership, nor how this committee was appointed.

However, I will not assume entire ignorance on these points, for I believe that Mr. Griffin claims as members all who in years gone by have sent him a Post-office order or a few postage stamps—many of whom, as he well knows, do not now take part in his proceedings, or approve of his method of agitation.

Thus, on the occasion of a deputation to Mr. Sotheron Estcourt, when Mr. Griffin was spokesman for the Association, although he talked of 1648 members, he mustered but seventy-five companions, and held 468 proxies, which last were distributed between three different schemes.

Sir, who ever heard of such an Association as this? Well may Mr. Griffin complain that the funds are very low, and well may he find that even his determination and perseverance—for which we all give him credit,—have not brought forth any striking results.

Many Poor-Law Medical Officers desire to see this imaginary Society replaced by a genuine Poor-Law Medical Reform Association; a "real and simple organisation," which I am certain might be speedily and without difficulty formed.

When the late President issued his scheme for our consideration, the Poor-Law Medical Officers in many districts met in sections to discuss and consider it. How easy would it then have been to have banded these units together into a substantial and veritable Association. We could then by branch meetings and correspondence with a central head, deliberate upon, discuss, and agree among ourselves, as to our "grievances," and their remedy. We might at least decide what we ourselves really want; what we have a chance of obtaining; and the best mode of effecting our objects. So we might go to Parliament with a well-considered and matured plan—acceptable to ourselves, and "reasonable and feasible too," in the eyes of Guardians and Poor-Law Boards. We might then avoid the somewhat ludicrous position occupied by the deputation before-mentioned, which put before Mr. Sotheron Estcourt three schemes of payments, differing by something like £100,000 in the amount it was estimated they would raise. Well might the President observe, "I do not think it right to lay any Bill on the table of the House until we can get a far greater amount of unanimity of opinion on the part of those concerned than up to this moment has been obtained."

I believe, sir, that "a real and simple organisation" would soon settle all the questions in dispute, so far as we ourselves are concerned, and am certain that such a combination might be readily effected; and Mr. Griffin is just the man to do it, if he will but set about it. And so he will have a much better chance of effecting his objects than by aspiring to "the office of a legislator," and issuing every few months a fresh "Draft Act of Parliament." I am, &c.

PAUL JONES.

COMMUNICATIONS have been received from:—

Professor SIMPSON; Mr. TEALE, Leeds; Dr. CONOLLY; Dr. WEST; Dr. SIEVEKING; Dr. DOIG, Leith; Dr. GRANVILLE; Dr. SMYTH; Mr. ROBERTS; Mr. JOHNSON; Mr. KEALY; Mr. COOKE; Mr. MICHELL CLARK; Dr. JOHNSON; Mr. BURNES; Dr. DEVENISH; Mr. WHEATLEY; Mr. HUGHES; Mr. FARRANT; Mr. GILL; Mr. JONES; Mr. BRENT.

APPOINTMENTS FOR THE WEEK.

December 10. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

12. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Clinical Discussion.

13. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY, 8½ p.m. (Ballot 7½.) Dr. Habershon "On the Etiology and Treatment of Peritonitis." Dr. Tilt "On the Influence of Tropical Climates on Inflammatory Diseases of the Womb."

14. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopedic Hospital, 2 p.m.; Middlesex, 1 p.m.

HUNTERIAN SOCIETY, 8 p.m. Dr. Peacock "On the French Millstone Makers' Pthisis." NORTH LONDON MEDICAL SOCIETY, 8 p.m.

15. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

16. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

By Mr. Fergusson—For Phymosis; Removal of Growth from Eyelid. By Mr. Bowman—Formation of New Eyelid.

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBURY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBURY and SONS (Proprietors of the "PULVIS JACOBI VER., NEWBURY'S.") 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, previous, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Great Saving in the Purchase of New

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloater Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of CROSSE and BLACKWELL, 21, Soho-square.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s. 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE. Splendid Pieces for Lecturers and Museums.

Anatomical Students are

invited to inspect the Stock of Skeletons, Skulls, separated and entire—Vertebrae, Hands and Feet on catgut, and various loose bones, which are well prepared, perfectly white, and free from grease or smell. The selection of this stock having been made by a good Anatomist W. M. can confidently recommend them as being well marked, perfect bones, at low prices.

W. MATTHEWS,

Surgical Instrument Maker to King's College Hospital, 8, Portugal-street, Lincoln's-inn, W.C.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,
June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT in WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

TRADE MARK.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

MUTUAL LIFE ASSURANCE.

Scottish Equitable Life Assurance Society. INSTITUTED 1831.

HEAD OFFICE:—26, ST. ANDREW-SQUARE, EDINBURGH.

The Profits are divided every three years, and wholly belong to the members of the Society. The last division took place at 1st March, 1859, and from the results of it is taken the following

EXAMPLE OF ADDITIONS.

A POLICY FOR £1000, DATED 1st MARCH, 1832, is now increased to £1654 9s. 5d. Supposing the age of the Assured at the date of entry to have been 40, these Additions may be surrendered to the Society for a present payment of £363 17s. 8d., or such surrender would not only redeem the entire premium on the Policy, but also entitle the party to a present payment of £104 4s., and, in both cases, the Policy would receive future triennial additions.

THE EXISTING ASSURANCES AMOUNT TO	£5,272,367
THE ANNUAL REVENUE	£187,240
THE ACCUMULATED FUND (arising solely from the Contributions of Members)	£1,194,657

ROBT. CHRISTIE, Manager.
WM. FINLAY, Secretary.

LONDON OFFICE, 26, POULTRY, E.C.
ARCHD. T. RITCHIE, Agent.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting, of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

“From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

“A. B. GARROD, M.D., F.R.S., F.R.C.P.

“Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital.”

“I have endeavoured to ascertain the relative activity of Messrs. M'Andrew's scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M'Andrew's scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

“That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M'Andrew's Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

“GEORGE JOHNSON, M.D., F.R.C.P.

“Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital.”

CAUTION.

Chlorodyne.—Any Preparation advertised or sold under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals.

Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to

J. T. DAVENPORT, Pharmacist, 33, Great Russell-street, Bloomsbury, London.

N.B.—Medical men are earnestly solicited to attach the words “Dr. J. Collis Browne's Chlorodyne” when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.

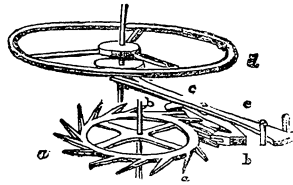

The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner are at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of the active principles of cubebs—namely, the cubebine and the essential oil in their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

LEVER ESCAPEMENT.

Benson's WATCHES.

“Perfection of mechanism.”—

Morning Post.

Gold 4 to 100 guineas.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

“PULVIS JACOBI VER., NEWBERRY'S.”

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as “Pulvis Jacobi Ver.” but to which it is now necessary to add the name “NEWBERRY'S,” to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.

45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Ford's Eider-Down Jackets for Invalid

LADIES, Young Persons of Delicate Constitution, and all who suffer from cold, to whom they are a great comfort. No other article is so light and warm; it is, therefore, a desideratum to ladies recovering from illness, as also to those used to hot climates, while for travelling or wear in the carriage during cold weather it is indispensable. Superfine cloth Cashmere lined Silk, Either-down quilted, price Two Guineas. Sent, post free, on receipt of Post-office order and the size round chest under arms.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Ford's Aixa Jackets, with sleeves

à la Zouave, open to the corsage, may be had plain or beautifully embroidered; price in cloth, 21s.; Velvet, 42s. and 63s. The half-guinea cloth Jacket, for in or out-door wear, surprises every one for cheapness and style. Patterns and Pictures of any of the above sent free to all parts of the world.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

H. Silverlock's Medical Label Ware—

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, *nature's true and only purifying agent*; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of

BERRY, BROS. and CO. 3, St. James's-street, London.

S. Bowles, late Windsor & Co., Phial

and BOTTLE MERCHANTS, Dealers in Druggists' Sundries, &c., 6, James-street, Covent-garden, W.C. The cheapest house in London for every description of Medical Glass of the best quality.

Samples and Prices forwarded free on application.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers); and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Medical Registration Office.

32, SOHO-SQUARE, W.

NOTICE.—In accordance with Sect. 27 of the Medical Act, no name can appear in the next printed and published copy of the MEDICAL REGISTER which does not appear in the General Register, as existing on the 1st day of January, 1860.

November 21, 1859.

Royal College of Surgeons of ENGLAND.

Notice is hereby given, That the Primary or Anatomical Examination for the Diploma of Member of this College will be held on TUESDAY, the 24th of January next, and following days. And that the Surgical or Pass Examination for the Diploma of Member will be held on TUESDAY the 31st of January and subsequent days. Particulars relating to these Examinations, may be obtained on application at the College.

EDMUND BELFOUR, Secretary.

December 6th, 1859.

Royal Westminster Ophthalmic HOSPITAL, KING-WILLIAM STREET, CHARING-CROSS.

A COURSE of LECTURES will be delivered at this HOSPITAL, upon the Anatomy, Physiology, Surgery and Diseases of the EYE, in accordance with the Regulations of the Army and East India Boards, by HENRY HANCOCK, Esq., and HENRY POWER, Esq. The Use of the Ophthalmoscope, and the Microscopical Anatomy of the Eye, by JABEZ HOGG, Esq. To COMMENCE on 5th December, 1859, at 12.30. Fee for the Course, including Three Months' Hospital Practice, £5 5s.

South Staffordshire General Hospital.

A SPECIAL GENERAL BOARD of GOVERNORS of this Charity will be held on TUESDAY the 3rd day of January next, at ELEVEN o'clock precisely, for the purpose of ELECTING a SURGEON to fill the vacancy occasioned by the death of the late Richard Sandford Esq. Candidates, who must be Fellows or Members of the Royal College of Surgeons in London, Edinburgh, or Dublin, are requested to send in their Testimonials and Qualifications under cover to the Secretary, on or before Saturday the 24th day of December next.

By Order of the Weekly Board,

BENJAMIN SMITH, Secretary.

Wolverhampton, 29th November, 1859.

Operative Surgery.—Army Medical

BOARD.—The new Regulations of the Army Medical Department, requiring that every Candidate for a Commission "must produce a Certificate of Attendance upon a Course of Operative Surgery, given separate and distinct from that of general Surgery, in addition to a Certificate of having himself performed all the great operations on the dead body." Mr. SPENCER WELLS will commence a Course of LECTURES and DEMONSTRATIONS (in compliance with these Regulations), at the GROSVENOR-PLACE SCHOOL of MEDICINE, immediately after the Christmas Vacation. For particulars, apply to Dr. Richardson, Hon. Secretary, 12, Hinde-street, W.

Medical.—Wanted, by a Gentleman, a

SITUATION as ASSISTANT to a Surgeon, or General Medical Practitioner. The advertiser, who is a L.S.A., can produce most satisfactory Testimonials. Please address L.S.A., 104, Strand.

To Medical Men.—A Gentleman

having spent much time in looking out a suitable Opening for a young Solicitor, has discovered an excellent Opening for a Pure PHYSICIAN, where there is none amidst a population of 60,000 inhabitants, and where a gentlemanly qualified Man might realize an excellent Practice. Terms £50 down, or £20 and 10 per cent. upon the first three years' Practice. Address, P. F. with Name and Residence, to D. G. D. 66, Cheapside.

For Immediate Disposal, a First-Class

GENERAL PRACTICE, of long standing, in a large Market Town, in the Midland Counties; realising above £600 per annum. The House is commodious, and well adapted in point of locality for a Medical Practitioner. The present Incumbent being desirous to relinquish General Practice, would be satisfied with a Moderate Premium. Particulars may be learnt by letter, addressed to Mr. Adams, Chemist, Stoke-upon-Trent.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Bethlem Hospital.—Medical School.

—Members of the Medical Profession, and Medical Students desirous of Attending the Practice of Bethlem Hospital, are requested to enter their names at the Hospital on or before the 1st of January next.

Admission fee, for three months' Attendance on the Practice and Lectures, £3 3s.

The Medical Officers will enter Students and give all necessary information.

December 7, 1859.

A. M. JEAFFESON, Clerk.

A Surgeon in a large Provincial Town

wishes to engage a Gentleman as VISITING-ASSISTANT. His principal duty will be to take Clinical Notes in a Workhouse Hospital. All applications will be considered confidential, and should specify qualifications for such work, and the amount of salary expected. Address, M.D., John Jones, Esq., 17, Pine-street, York-street, Manchester.

Hoo Union, Kent.—Medical Officer.

—The Guardians of this Union will, at their meeting, to be held at the Union-house, Hoo, on Thursday, the 15th December instant, at Ten o'clock in the forenoon, appoint a MEDICAL OFFICER for the Hoo Union District and Workhouse, in the place of Mr. W. J. M. Cunningham, resigned. The Union comprises an area of 20,862 acres, and at the last census contained a population of 2340 persons. The salary, (subject to the approval of the Poor-Law Board) will be £100 per annum, together with the extra fees and allowances authorised by the orders of the Poor-Law Board. And the person to be appointed must be duly qualified, in accordance with such orders. Further particulars may be known on application to F. FURRELL, Clerk to the Guardians, Rochester.

December 2, 1859.

Death Vacancy.—Country Practice.—

In consequence of the demise of a General Practitioner in a populous neighbourhood of the Midland District, an excellent opportunity offers for an energetic Medical Man to succeed to the Practice. There are several Club Appointments, and the whole connexion would be easily transferred. The successor would be expected to take the Drugs, Instruments, and Book Debts, at a fair valuation. A horse, and transfer of a house at option. The command of £300 is requisite, and any gentleman treating immediately will find the terms extremely advantageous. Apply immediately, by letter, to M. R., Mr. Savage, Pelham-street, Nottingham.

Partnership.—An advantageous

opportunity offers to a respectable and Duly-Qualified Young Gentleman, of industrious habits, to take the active part in a PRACTICE of upwards of twenty years' standing, and with a view to an ultimate Succession to the whole.—For particulars, apply to S. S., THE LANCET Office, 423, Strand, London, W.C.

Liquor Castanea Equina. — Messrs.

REW and Co. respectfully solicit the attention of the Profession to this preparation of the Horse Chestnut. Taken internally, for Rheumatic Gout and Rheumatism, it is a safe, agreeable, and most efficacious remedy. Dose, 2 to 4 drachms. Price 12s. per lb. The Oil of Horse Chestnuts, applied externally for enlarged and stiff joints, acute or inflammatory pain of any kind, gives almost immediate relief. These genuine preparations of the Horse Chestnut are prepared only by

R. M. REW and Co., Operative Chemists, 232, Regent-street, London.

Mr. Jones' Elastic Uterine Truss.—

This Truss combines in its construction strength, lightness, and elasticity, is easy to wear, and efficient in its application. It affords great relief in cases of Uterine Pain, often occurring from relaxation in delicate females, and is of inestimable value in all cases of Prolapsus Uteri, rendering the use of pessaries entirely unnecessary.

N.B. Apply to the Inventor, Mr. Jones, Surgeon, 43, Friargate, Derby, or to Messrs. Longdon and Co., Wholesale Manufacturers, Derby.

London: Printed by CHARLES REED and BENJAMIN PARDON, of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and Published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—December 10, 1859.

Royal College of Surgeons of England.

REGULATIONS RELATING TO THE PRELIMINARY EXAMINATION OF CANDIDATES FOR THE DIPLOMA OF MEMBER OF THE COLLEGE, WHICH WILL COME INTO OPERATION FROM AND AFTER THE 1ST OF JANUARY, 1861.

Candidates for the Diploma of Member of this College who shall commence their Professional Education on or after the 1st of January, 1861, will be required to produce one or other of the following Certificates:—

1. Of Graduation in Arts at a recognised University.
2. Of an Examination for Matriculation, or such other Examination as shall, in either case from time to time, be sanctioned by the Council of this College; at a University in the United Kingdom; at a recognised University in the Colonies; or at a recognised foreign University.
3. Of the Oxford, Cambridge, or Durham Middle-class Examinations; either Junior or Senior.
4. Of the Preliminary Examination for the Fellowship of this College.
5. Of the Previous Examination of the University of Cambridge.

Candidates who shall not be able to produce one or other of the foregoing Certificates, will be required to pass an Examination in English, Classics, and Mathematics; conducted by the Board of Examiners of the Royal College of Preceptors.

The following are the subjects of the Examination during the year 1861, viz.—

PART I.

1. Reading aloud a passage from some English author.
2. Writing from dictation.
3. English Grammar.
4. Writing a short English composition; such as a description of a place, an account of some useful or natural product, or the like.
5. Arithmetic. No Candidate will be passed who does not show a competent knowledge of the first four rules, simple and compound, and of Vulgar Fractions.
6. Questions on the Geography of Europe, and particularly of the British Isles.
7. Questions on the outlines of English History, that is, the succession of the Sovereigns and the leading events of each reign.

PART II.

Papers will also be set on the following eight subjects, and each Candidate will be required to offer himself for examination on one subject at least, but no Candidate will be examined on more than four:—

1. Translation of a passage from the first book of Caesar's Commentaries, De Bello Gallico.
2. Translation of a passage from St. John's Gospel in Greek.
3. Translation of a passage from Voltaire's "History of Charles XII."
4. Translation of a passage from the first two books of Schiller's "Geschichte des dreissigjährigen Krieges."

Besides these Translations into English, the Candidate will be required to answer questions on the Grammar of each language.

5. Mathematics.—Euclid, Books I and II. Algebra, to Simple Equations, inclusive.
6. Mechanics.—The questions will be chiefly of an elementary character.
7. Chemistry.—The questions will be on the elementary facts of Chemistry.
8. Botany and Zoology.—The questions will be on the Classification of Plants and Animals.

The quality of the handwriting and the spelling will be taken into account.

The Examinations will be held in London, until otherwise directed by the Council.

The Fee for the Examination will be the same as that paid at the Oxford Junior Middle Class Examination.

A Voluntary Examination, in anticipation of the period when the same will be compulsory, will be held on Tuesday and Wednesday, the 26th and 27th of June next, at this College.

Candidates desirous of being then examined, must signify their intention to the Secretary, on or before the 15th of May, 1860, and at the same time give notice of the subject or subjects in Part II., in which they purpose to offer themselves. No Candidate's name will be received after the 15th of May.

Every candidate will be required to pay a Fee of Fifteen Shillings, to be paid on or before the 15th of May.

8th December, 1859.

EDMUND BELFOUR, Secretary.

Burrows and Co., Wholesale Wine

MERCHANTS, LIVERPOOL.

STORES—LIME-STREET. OFFICES—54, DUKE-STREET.

The Proprietors beg most respectfully to call the attention of the Trade, Noblemen, Clergy, and the Public in general, to their extensive stock of Choice Wines of rare Vintages.

B. and Co. are not disposed to comment upon the purity of their Wines which is daily most laudably acknowledged by the Public, and eminent Medical Men of all countries, as the increasing patronage of the highest families in the land is a sufficient guarantee.

They beg to call particular attention to their Pure Tonic Wines, as being so valuable to Invalids, and persons of weak stomachs.

A Sample Case, containing three full sized Wine-bottles, will be forwarded to any address, on receipt of Post-office Order for 6s. 6d., or a dozen for 24s.

It is a well-known fact that impure and adulterated Wines are the greatest foes to health, producing acidity in the stomach, and debilitating the digestive organs, while pure Wines will accelerate the digestive powers, invigorating, strengthening, and bracing the nervous system.

Their Tonic Wine is admitted to be most essential to Invalids both old and young, and should never be absent from the homes of the weak and sickly. Its properties are clearly acknowledged and appreciated by the leading men of the Faculty, both at home and abroad.

To prevent imposition, each bottle is sealed with the name of the firm. All orders to be made payable to Henry Burrows.

CAUTION.

Chlorodyne.—Any Preparation adver- tised or sold under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals.

Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to

J. T. DAVENPORT, Pharmacist, 33, Great Russell-street, Bloomsbury, London.

N.B.—Medical men are earnestly solicited to attach the words "Dr. J. Collis Browne's Chlorodyne" when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.

The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner are at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

Chlorodyne.—R. Freeman, Pharma-

ceutist, Kennington-road, London, S., informs the Profession and Trade that he has for years made, and extensively used in his business, Chlorodyne; and that he is supplying it in one-ounce stoppered bottles at 1s. 6d. each, four-ounce bottles at 5s. each. He guarantees it to be uniformly and properly prepared, and superior to any other makers', though their charge be ever so exorbitant; and he trusts that the low-ness of price at which he offers it will allow the Profession to use it in common practice and at public institutions, so that its extraordinary beneficial effects may be enjoyed by the poorest sufferer.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebine and the essential oilen their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

Students' Achromatic Microscopes,

Complete at £3 3s. C. BAKER, of 243 and 244, High Holborn, begs to inform the Medical Profession that from the introduction of improved machinery he is now enabled to supply the cheapest and most useful Medical Microscope ever manufactured; they are fitted up complete with three beautifully-defining Achromatic Object-Glasses, that are capable of showing in a very superior manner all the usual Physiological Objects quite equal to the more expensive kind. Catalogues free by post. Established in 1765. (Opposite Day and Martin's.)

Second-hand Surgical Instruments.—

The Largest and Cheapest Assortment in London, at C. BAKER'S, 243, and 244, High Holborn; also every description of New, of the best quality, at the lowest possible prices: viz.—

	s. d.		s. d.
Dissecting Cases in Ivory .. 15	6	Stethoscopes	2 0
Ditto Ditto Ebony .. 13	6	Speculums	3 6
Elastic Bougies and Catheters .. 10	0	Enemas	from 6 6
Clendon Teeth-Forceps 3	0	Midwifery Forceps	8 6
Tomes Ditto	5 6	Lancets	1 0
Bennett's Speculums 12	6	Dressing Cases	17 6
German Silver-Plated Catheters .. 30	0		

All other Articles equally cheap, and warranted of the finest quality. Medico-Galvanic Coils and Batteries, with Conductors, complete, 32s. 6d. Established 1765. (Opposite Day and Martin's.)

Surgical Instruments, and every Im-

plement necessary for Surgeons and Druggists, can be had (warranted best quality and moderate prices), retail as well as wholesale, from the Manufacturer, JAMES ARNOLD, 35, WEST SMITHFIELD, St. Bartholomew's Hospital, London.

Single Circular Truss, 2s. 6d.; double ditto, 5s.; on Salmon's Expired Patent, 4s. 6d.; double ditto, 9s.; on Coles's Expired Patent, 5s.; double ditto, 10s.; Cotton Net Suspensory Trusses, from 10d.; Elastic Stocking Net bandage, 4d. per yard; Case of Tooth Instruments, £1; Case of Cupping Instruments, £2 13s. 6d.; Case of Pocket Instruments, £1; Brass Enema Syringe, complete in mahogany case, 10s. and 12s.; Case of Dissecting Instruments, Ivory Handles, 15s.; best Bleeding Lancets, per dozen, 18s.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION of ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication; and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication.

52, Fleet-street. At home from Ten till Five.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De JONGH, of the Hague. I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S. Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

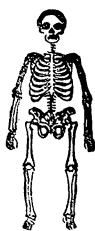

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to show that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked.

STUDENT'S CASE OF OSTEOLOGY, COMPLETE.

Splendid Pieces for Lecturers and Museums.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

J. & E. BRADSHAW, late

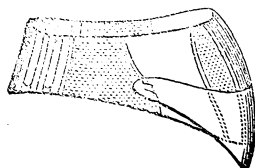

Shoolbred and Bradshaw, 34, Jermyn-

STREET, beg to call attention to the various improvements in

PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c.—N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A Female to attend on Ladies.

TRADE MARK.

Brown & Polson's Patent Corn Flour,

preferred to the best Arrowroot. DELICIOUS IN PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—"This is superior to anything of the kind known."

Trade Mark and Recipes, on each Packet, 4, 8, and 16 oz.

Obtain it from Family Grocers, Chemists, &c.

77A, Market-street, Manchester; and 23, Ironmonger-lane, London.

Or SACCHARATED CAPSULES.—Copaiba and Cubebs are, doubtless, the best remedies, but these drugs are of a repulsive taste and odour, and occasion colicky pains, nausea, and gastric disturbance. M. Jozeau has succeeded in rendering these valuable therapeutic agents perfectly innocuous, by increasing, in his Copahine, all the curative properties. This preparation has been adopted by the Paris Academy of Medicine, after more than a thousand trials in Paris, and the different London Hospitals, viz., St. Thomas's, Guy's, and St. Bartholomew's, under the care of Messrs. Lloyd, Poland, and Le Gros Clark. "Lancet," Nov. 6, and Dec. 10, 1852. The Copahine, which is in form of a pretty pink sugar-plum, effects a cure in about six days, either in recent or chronic diseases. 100 Capsules, 4s. 6d., at G. JOZEAU'S, French Chemist, 49, Haymarket, London; 22, Rue St. Quentin, Paris; and all the most important Chemists.

Important Saving, by Prepayment,

in the PURCHASE of NEW WHITE ROUND MOULDED VIALS OF THE BEST QUALITY. PELLATT and Co. submit the following PRICES of VIALS, for PREPAYMENT only:—

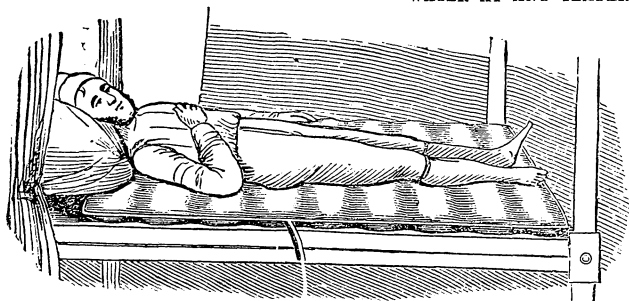

1 oz., 10 dr., and 1 1/2 oz. per Gross, 6s.	In quantities of not less than
14 dr., and 2 oz. " 7s.	Six Gross, assorted to suit the
3 oz. " 8s.	convenience of the purchaser,
4 oz. " 10s.	delivered to carriers in London.
6 oz. " 15s.	No charge for Package.
8 oz. " 18s.	Breakage at risk of Pur-
1 1/2 oz. graduated in 3 doses, " 12s. 6d.	chaser.

The above Prices being based upon a calculation which excludes all charges whatever between the Manufacturer and the Consumer, no attention can be paid to any order not accompanied by a remittance in full, made payable in London.—P. and Co. do not supply Green Glass.—Orders and remittances to be addressed,

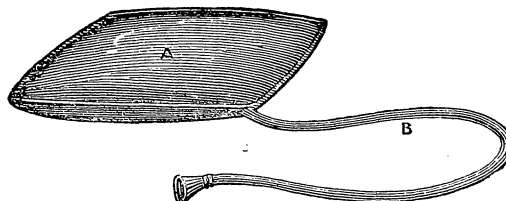

PELLATT & Co.,

FALCON GLASS WORKS, LONDON.

HOOPER'S HYDROSTATIC BEDS, OR MATTRESSES AND CUSHIONS, FOR PLACING ON AN ORDINARY BEDSTEAD. WATER AT ANY TEMPERATURE MAY BE USED.

HOOPER'S FULL-LENGTH MATTRESS OR HYDROSTATIC BED,
For Bedsores, Cancer, Coldness of the Body, Consumptive Cases, Diseased
Joints, Dropsy, Fevers, Fractures, Gout, Gun-shot wounds.

HOOPER'S CUSHION FOR GENERAL PURPOSES.

ANY SHAPED CUSHION CAN BE OBTAINED,
For Inflammation of the Bowels, Lassitude, Paralysis, Rheuma-
tism, Spinal Affections, Sloughing Sores, Ulcerated Cartilages,
and all Invalids.

HOOPER'S PATENT INVALID BED-LIFT.

THE OBJECT of this INVENTION is to enable the Patient to be raised in any position above the Bed, so as to allow the Medical Attendant, or Nurse, to get at any part of the body that may be requisite; and also that the Bed may be re-made, the chamber utensil used, and removed with facility.

FIG. 2.

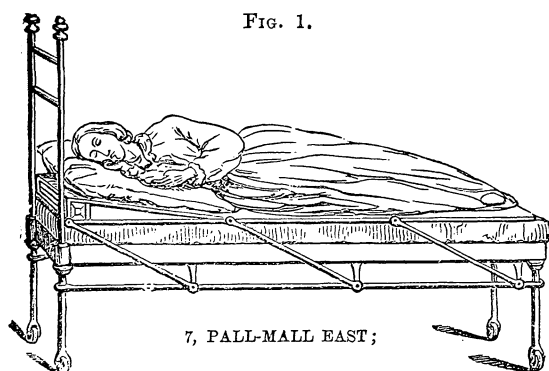

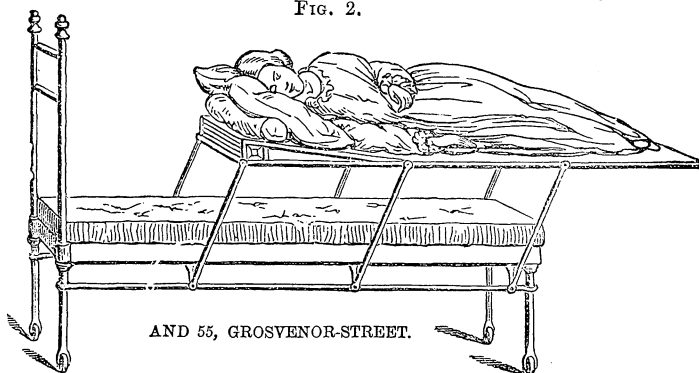

FIG. 1.

7, PALL-MALL EAST;

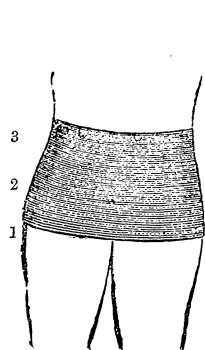

AND 55, GROSVENOR-STREET.

FIG. 1 represents a patient on the Patent Lift Bedstead, the
Lifting Apparatus not being in use.

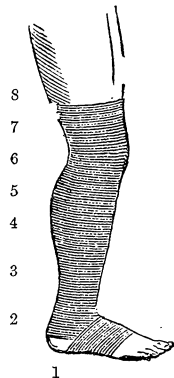

FIG. 2 represents the patient raised up from the ordinary level of the Bed by
means of the Lift, so as to enable the Medical Attendant, or Nurse, to perform
any of the offices before-named.

HOOPER'S SPIRAL ELASTIC SUPPORTERS.

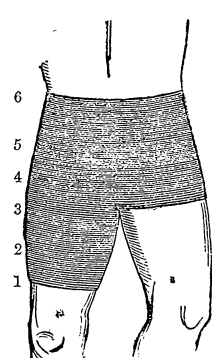

The Figures 1, 2, 3, &c. show the points at which the measures should be taken; the
length should also be stated.

ABDOMINAL SUPPORTER.

STOCKING ABOVE THE KNEE.

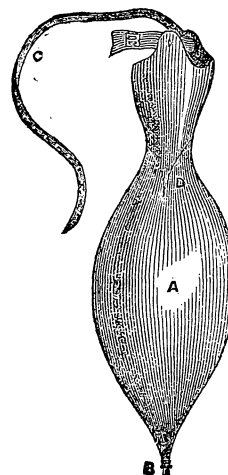

ABDOMINAL SUPPORTER AND
THIGH-PIECE.

Constructed of a light porous material, unique in giving continuous and permanent
pressure, can be accurately adjusted, and readily drawn over the parts requiring their
use.

HOOPER'S URINALS,

WITH VALVE TO PREVENT LEAKAGE,

For Invalids, or Railway Travellers; whether Sitting,
Reclining, or Walking; they are not affected by boiling
water, and may, therefore, be easily kept clean.

WATERPROOF SHEETING. FOR PROTECTING BEDDING,

At a great Reduction in Price. It is soft and inodorous, and not acted on by Urine, Acids or Alkalis, and may be washed as
Family Linen.

EXTRACT OF REPORTS from the Medical Department of the Three Presidencies of the Hon. East India Com-
pany; also Reports and Letters from numerous Members of the Medical Profession free by post.

ORIGINAL LECTURES.

CLINICAL LECTURES

ON

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXV.

ON OVARIAN DROPSY.—
THE DIFFERENTIAL DIAGNOSIS—*continued*.—
THE MEDICAL TREATMENT.

GENTLEMEN,—I have hitherto omitted to point out to you—though, perhaps, it is a matter of no great practical moment—how you can generally discover whether an ovarian tumour of such large size as to fill up and distend the abdominal cavity took its origin from the right or from the left ovary. The history given by the patient, as to the side in which the swelling first appeared, is sometimes fallacious; but you can almost always satisfy yourselves on this point by attending, in the first place, to the relative situation of the intestines at the two sides of the abdomen, as ascertained by percussion. I have already stated that the tumour usually lies immediately in contact

FIG. 1.

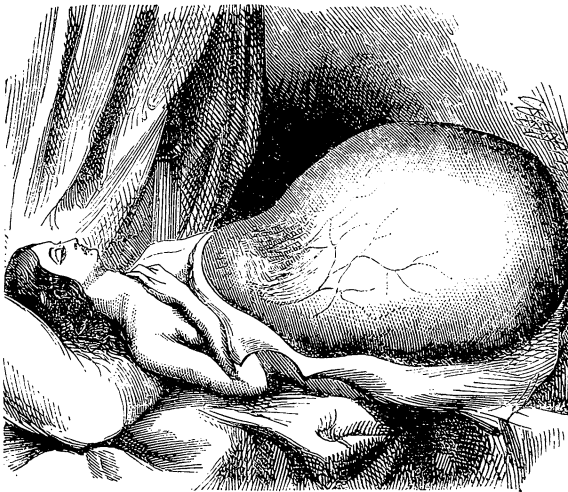

FIG. 1.—Drawing of a large ovarian tumour showing the position of such tumours immediately behind the abdominal wall, and in contact with the omentum.—(Bright.)

with the anterior abdominal wall, and in front of the small intestines, and that in the progress of its development it pushes aside the intestinal canal laterally and upwards, as the pregnant uterus does. But this statement expresses but imperfectly the relation of the tumour to the intestines; for you will find that while that mass of bowel which lies on the side opposite to that from which the tumour springs is thus, more or less, pushed aside, the mass of bowel which lies on the same side is displaced laterally to a still greater degree, and, indeed, is often overlapped, as it were, by the ovarian swelling [see Fig. 2 in last Lecture]. Hence, when the tumour grows from the right ovary, for example, it hides the caput cæcum coli, and only pushes aside the descending colon, so that in such a case you obtain the resonant percussion-sound at a higher level, and nearer the anterior surface on the left side of the abdomen, than you do on the right side. But sometimes, as you can see from the accompanying sketches of a case copied from a drawing of Dr. Bright's, in "Guy's Hospital Reports," when the tumour is of unusually large dimensions, the whole of the intestines, large and small, may come at last to lie behind the tumour at both sides, so that percussion has to be exercised very low downwards on either flank before the position of the bowels

can be discovered. Even in such a case, however, you will usually be able to arrive at a knowledge of the ovary from

FIG. 2.

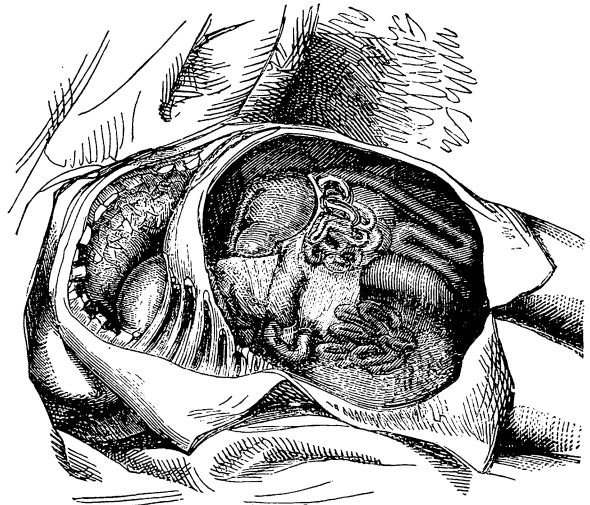

FIG. 2 shows the compression and displacement of the abdominal and thoracic viscera produced by the tumour.—(Bright.)

which the tumour springs by ascertaining, in the second place, the position of the uterus and the direction in which it is displaced. For when an ovary becomes morbidly enlarged, it almost always pushes the uterus in the progress of its growth to the opposite side; so that when the tumour arises in the right side, the uterus is found to be pushed or dragged upwards towards the left side; and when a sound is introduced into the internal cavity, instead of passing up directly behind the pubes, it is felt to pass obliquely upwards towards the brim of the pelvis of the left side. Conversely when you find that in introducing a sound into the uterus in a case of ovarian dropsy, the instrument passes obliquely upwards to the right side, you may be pretty certain that the tumour has originated in the left ovary. But, passing from this matter, let me remind you that at our last meeting we were occupied with the consideration of some of the diseases with which cystic ovarian tumours had been, or were liable to be, confounded, and the manner in which a differential diagnosis was to be established between them. I believe I have already touched upon the special tumours and forms of disease that are most frequently mistaken for ovarian growths, and in regard to which practical errors have been most frequently committed. There still, however, remain one or two others I should like briefly to turn your attention to. One of these I neglected to advert to, when previously discussing the differential diagnosis of pregnancy and morbid tumours, and states of the uterus from ovarian dropsy. I allude to

8. *Dropsy of the Cavity of the Uterus, and of the Amnion*.—Sometimes, though rarely, an accumulation of fluid takes place within the cavity of the unimpregnated uterus; the canal of the os or cervix uteri being of necessity for the time occluded. I attended an unmarried lady, with the late Dr. Taylor, in whom I repeatedly drew off, with a small catheter—passed with some force and difficulty—large accumulations of serous fluid from the cavity of the uterus. The fluid was secreted by a cauliflower or canceroid tumour seated at the fundus uteri, and occasionally the uterus was distended by its accumulation to the size of a uterus in the fifth or sixth month of pregnancy. The womb sometimes becomes enlarged and distended by fluid derived from another source. Some of you had an opportunity of seeing, during last winter session, a case where the vagina had become occluded so that the catamenial fluid was prevented from escaping, and as it lodged and accumulated within the cavity of the uterus, that organ became at last of large size, and had a fluctuating feeling which made it very closely to resemble a cystic ovarian tumour. These two cases afford you examples of fluid accumulating in the unimpregnated uterus producing such a change in its form, size, and consistence as is extremely apt to lead to error in diagnosis. But morbid accumulation of fluid within the pregnant uterus in the form of dr

amnion, or hydramnios, is more frequent. The shape, feeling of fluctuation, etc., of the distended uterus is sometimes very similar to that of an ovarian dropsy. I saw lately, with Dr. Dunsmure, a lady who had been delivered of a full-sized, living child, eight months previously, and who considered herself to be again about four months pregnant. The tumour in the abdomen was very fluctuating, and as large as the uterus at the ninth month. For a moment I thought that it was probably a case of ovarian dropsy, but a vaginal examination at once dispelled that idea, for I found the os uteri open, and the cervix bulging out above it like a uterus at the full term of gestation. The patient had been suffering severely and alarmingly from constant vomiting, neuralgia, etc. I passed a stylet into the cavity of the uterus. Above four hundred ounces of fluid ran off, and two small twins were found in utero. The vaginal examination of the uterus, and, if necessary, the introduction of the uterine sound, will always, in this way, enable you to distinguish dropsy of the uterus from dropsy of the ovary. But enlargements of more distant abdominal organs are sometimes confounded with ovarian tumours and dropsies. Thus, occasionally, we find, for example, an

9. *Enlarged and dependent Liver mistaken for Ovarian Dropsy.*—This error is certainly not a frequent one in diagnosis. But I have seen more than one instance of it, where the hypertrophied liver stretched downwards, as it sometimes does, into nearly the right iliac region. Such hepatic enlargement may be produced, as you know, by various morbid states of that organ,—as by simple hypertrophy, by some forms of chronic inflammation, by collections of hydatids, and by deposits of carcinoma, etc., among the hepatic structures. This year I saw in consultation in England, a patient, whom two excellent Medical Practitioners believed to be the subject of ovarian disease, with one cyst projecting forwards, and very fluctuating under the thin and attenuated abdominal parietes. But a new and careful examination satisfied us all that the great mass of the tumour was formed by an enormously enlarged liver, and that the projecting fluctuating part was only a greatly distended gall-bladder. In this, as in other similar cases, when the patient is laid supine, you can move upwards the hepatic mass, without producing in any degree any corresponding movement upon, or dragging upwards of the uterine organs. There is a line of resonance from the presence of the intestinal canal, between the tumour and the brim of the pelvis, while the range of dullness on percussion extends upwards from this line to the sixth or seventh rib on the right side. If the patient has been seen by the Practitioner from the first, he will have traced also the tumour extending from the edges of the ribs downwards, instead of, as in ovarian disease, from the ilia region upwards.

10. *Hypertrophied Spleen.*—You sometimes meet with another variety of tumour, lying in the left side of the abdominal cavity, which has also, in some rare instances, been confounded with ovarian growths. I refer to extreme enlargements or hypertrophies of the spleen. Such a splenic hypertrophy appears as a tumour somewhat elongated in form from above downwards, smooth, resistant, and inelastic to the touch, on the whole with a regular and unbroken surface, but usually with one or more indentations on the anterior margin. It passes upwards beneath the ribs, and by percussion can be ascertained to reach to the very summit of the abdominal cavity, and even to push the diaphragm unusually high up. It reaches sometimes considerably beyond the middle line of the abdomen in front, and its inferior margin can in most cases be distinctly traced by palpation above the level of the crest of the ilium. But sometimes a splenic tumour extends further downwards into the iliac fossa and the pelvic cavity, so that its lower border cannot be easily defined, and these are the cases where a splenic enlargement becomes liable to be mistaken for ovarian dropsy. Cases are on record where such a mistake has been made; but if you will only bear in mind the physical characters which I have spoken of as distinctive of this form of tumour, I think you may save yourselves from such an error. If you are still in doubt, the history of the case will probably solve it. For you will find on inquiry that, as in excessive hypertrophies of the liver, the tumour, if it be a splenic one, grew from above, and is chiefly moveable in an upward direction; whilst, on the contrary, an ovarian tumour is noticed first in the lower part of the abdominal cavity, and is incapable of being moved upwards to any

considerable extent. On examining the blood, moreover, in a case where the spleen is thus enlarged, the number of the white or colourless corpuscles, as you are all well aware, is sure to be found greatly multiplied; and such an increase in the number of these globules is not likely ever to be met with in any case of ovarian dropsy, except as an accidental and temporary phenomenon. Again, I have known an ovarian tumour to be mistaken for a morbid condition of the kidney, and the reverse; and more particularly has this error been committed with regard to the

11. *Loose or Mobile Kidney.*—This condition is by no means unfrequent, and is often mistaken for more alarming diseased states, and particularly for various organic affections of the abdomen. I have known it confounded with tumour of the ovary; but I have known it far more often mistaken for hepatic disease, and the unfortunate patients, in consequence, leeches, blistered, mercurialised, etc., and all most unnecessarily. The kidney is normally bound down in its site by the peritoneum covering it on its anterior surface. But when it enlarges from any cause—and the kidney is liable to various types of transitory hypertrophy and increase of size—it stretches and pushes its peritoneal coat before it, till at last the peritoneum envelopes it, first laterally, and then it may be even posteriorly, until at last the organ becomes pediculated, as it were, like a polypus,—or, more truly speaking, until the kidney makes for itself a more or less perfect mesonephron formed of a double reflection of peritoneum, on the same principle as the mesentery or mesocolon. I have seen this condition of parts on dissection. When the kidney becomes in this way loosened from its normal site, it sometimes falls so low down as to be mistaken for an enlarged ovary. This loose or mobile kidney is very often detected accidentally, having produced no special symptoms whatever. Occasionally, it seems to cause disturbances from time to time in the functions of the liver, stomach, and neighbouring viscera; and sometimes the floating kidney itself becomes swollen and painful from time to time. The loose and dislocated organ generally gives a sensation of sickness and pain, when compressed between the two hands of the examining Physician. You can usually readily feel it like a floating, or mobile tumour, if you lay the patient supine, and place her half-way between the positions on the side and back, with one hand placed on the renal region behind and the other in front. You feel a mass of the size of the normal kidney, which you can sometimes displace, to a limited degree, in various directions. Usually, however, it most readily pushes upwards under the false ribs, and sometimes it will slip up in this direction from your two hands—like an orange eluding your attempt to seize it. This form of loose kidney is much more frequent on the right than on the left side, though I have seen it in some patients simultaneously on both sides. It is a condition of matters which time and improved health, and especially the improved stoutness and fatness of the patient, certainly sometimes rectifies—as I have repeatedly witnessed. But here I have only to speak of it as liable to be confounded with ovarian disease. The size and form of the mobile kidney will enable you to draw the distinction between them; and if you have still doubts, the tracing the supposed tumour to its normal attachment and site in the renal region, and the freedom of all organic attachments between it and the ovarian region will dispel any difficulties.

12. *Distended Bladder.*—Finally, gentlemen, let me mention one other form of swelling which has been in a few instances, and usually only for a brief time, mistaken for ovarian dropsy. I allude to the kind which is formed by the urinary bladder when it becomes greatly over-distended. Called to such a case, and finding what you may at first suppose to be a cystic tumour, reaching as high as the umbilicus, and passing down to the pelvis, you might, for a moment, be led to imagine that it was of ovarian origin. And you will be all the more likely to be led into error if the retention has gone to such an extent as to have led at last to a form of incontinence, for the constant dribbling away of the urine may make you overlook the antecedent accumulation. In fact, you will find occasionally that patients pass urine from time to time without ever fully emptying the bladder, which thus continues to resemble a dropsical abdominal swelling. In a case of this kind, in which Berger was consulted as to the proper mineral waters which the patient should use, he introduced a catheter, and instantaneously cured the patient. But should you ever commit such a mistake in diagnosis as to confound a distended

bladder for an ovarian dropsy, and follow it up by the misdeed in practice of acceding to the patient's urgent demand for relief by tapping such a cyst, you can easily understand how fatal the double error might prove to be. But I do not anticipate that such an unfortunate error will ever be made by any of you; and certainly you can always avoid the danger of it, by carefully inquiring into the patient's history; and, where any doubt remains, or even any shade or suspicion of a doubt, by introducing a catheter into the bladder and finding if fluid may be there accumulated. In such a case the employment of the catheter is at once a means of diagnosis and a means of cure. Besides, in the differential examination of any doubtful and difficult examples of pelvic and abdominal tumours, it is a measure of physical diagnosis that we should never omit. The bladder is often displaced laterally by such tumours; it is often so displaced by large ovarian tumours; and you can only ascertain the degree and extent of its displacement by the use of the catheter or sound.

But I must bring these remarks on the Differential Diagnosis of Ovarian Dropsies to a conclusion, as I fear that I have already dwelt on this part of the subject too long; without, however, having exhausted it. There are other forms and varieties of abdominal and pelvic disease, which are sometimes, though more rarely, mistaken for cystic ovarian tumours, and the reverse; such as malignant and cystic tumours originating in the omentum, in the walls of the intestine, in the walls even of the stomach, in the pancreas and in the mesentery, in the subperitoneal cellular tissue, etc. But it would unreasonably exhaust your time and mine, if I were to dwell longer on these topics. In every doubtful case, before finally deciding that it is an ovarian cystic tumour, strive to make out that you have positively present the essential signs of that disease, and that negatively the signs are absent which belong to any analogous kind of abdominal or pelvic tumour. If you have still doubts on the subject,—and there are puzzling and perplexing cases which will leave you in doubt, despite the most careful and repeated examinations,—then, at all events, do not have recourse to anything active or dangerous in the way of treatment, as long as such doubt remains, lest you damage instead of benefiting your patient.

In describing to you, in my preceding lecture, the individual symptoms of ovarian dropsy, I made, I fear, various omissions, some of which I may take an opportunity of supplying when subsequently discussing various points in the Surgical treatment of the disease. In the meantime, let me pass on to the most important matter of all connected with our subject namely—

THE TREATMENT OF OVARIAN DROPSY.

The treatment of this disease may be divided into the Medical or Surgical. Under these two divisions, therefore, I should wish to speak at present of the means which may be employed for the alleviation or the cure of Ovarian Dropsy, and first of all as to the

A.—MEDICAL TREATMENT.

If you will take the trouble to look into the records of this disease you will find that observations have been published from time to time, by different authorities, as to the supposed good effects of various remedies in ovarian dropsies, and that cases are duly related in which it is averred that such remedies had been successful in causing a cure, or, at least, an alleviation of the malady. For my own part, let me state at once, I have no belief that any drugs or medicines ever removed a cystic multilocular growth or dropsy of the ovary. I would almost as soon expect to remove by them a foot, or a hand, or any integral part of the normal body. In any exceptional cases, where internal medicines have appeared to diminish ovarian tumours, you may rest assured that a primary error in diagnosis has been committed, and that the supposed ovarian growth was a meteorismic tumour of the abdomen, or ascites, or a specimen of some of those other maladies of a curable type that are often enough mistaken for ovarian disease. But in Medical works you may read, and read profusely too, of medicines—now of one kind, and anon of another—which have been much bepraised because of their imagined action in causing the absorption sometimes of the solid walls, sometimes of the fluid contents of ovarian cysts, thus bringing about, in one or in both of these ways, a reduction in the size of the tumour. The prin-

cipal remedies which have been supposed to be invested with this power, belong to the class of alteratives or deobstruents. Among those most frequently used with the object of reducing the size of ovarian tumours, preparations of mercury, of iodine, of bromine, of potass, and of lime, may, perhaps, be regarded as the chief. You will, however, find other classes of remedies also spoken of as possessed of power over ovarian growths. In works published before the beginning of this century it is not unfrequently argued and averred that the medicines which are found effectual in dispelling other forms of dropsy, are also capable of curing dropsy of the ovary. The word "dropsy" misled them; and the fluid formed in the sac of a new and morbid growth having received the same designation as an effusion in an ordinary serous cavity, it was imagined that the remedies that were curative in the latter should also be of service in the former. Hence arose the occasional use of diuretics, diaphoretics, and hydragogue cathartics in ovarian cystic disease. But I believe all trustworthy observers have now come to the conclusion that these classes of remedies, which are often so useful in the removal of the ordinary forms of dropsical effusion are of no use in the removal of the so-called dropsy of the ovary; though they may diminish the ascitic collection by which they are sometimes surrounded. And as for the special deobstruent and alterative remedies of which I have spoken, I believe I may, with perfect justice, say that they are at least as ineffectual. I use this remark as equally applicable to these drugs, whether they are exhibited internally as medicines, or applied externally in the various forms of ointments, plasters, fomentations, etc. Nay, the use of these so-called deobstruents is not only ineffectual; it is sometimes more—it is hurtful and injurious. I have seen mercury pushed both far and long, in patients suffering from ovarian dropsy. But I never saw any diminution in the size of the tumour result from it, nor was the patient's condition ever improved in any degree. On the contrary, poisoning with mercury has generally a detrimental and injurious effect on the patient's constitution—reducing her strength, and rather favouring the growth of the morbid mass than otherwise. For an ovarian cystic tumour is of the nature of a parasite, which grows the more rapidly in proportion as the system of the patient gets weaker, and thus the onward progress of the disease, instead of being checked by the use of mercury, is actually, though indirectly, promoted by it. Much evil, then, may result from the use of this drug; and doubtless much evil has followed its employment; while I believe it has never been of any real service in checking the growth of a cystic ovarian tumour. In all cases, therefore, of that disease I would most emphatically advise you to eschew it altogether. Liqueur potassæ was at one time frequently prescribed; and muriate of lime was often used by my predecessor, Dr. Hamilton, in cases of ovarian dropsy, with the view of leading to the absorption of the fluid. But when I tell you that their use for this purpose has been entirely, or almost entirely, given up by Medical men of the present day, you may understand how little they were found effectual for the desired object. Nor, I regret to say, have I anything more favourable to state with regard to the effects of iodine and bromine as remedies for the removal of ovarian growths. I have known iodine, or hydriodate of potass, tried long and perseveringly with no other effect than sometimes the unfortunate one of damaging and depressing the patient's constitution; and, from what I told you a minute ago, when speaking of the use of mercury, of the evil consequences of any deterioration of the patient's general health, you will see at once that it is not a remedy to employ actively in ovarian dropsy. Bromine, or bromide of potass, on the contrary, usually acts as a good tonic, and may be administered without any risk of injuring the patient. If it does no good, at least it will do no harm. When I come to speak of the treatment of fibroid tumours of the uterus, I shall try to show you that bromine exerts sometimes a decided influence in producing absorption or involution of that form of tumour; but I cannot say that I have seen any such good effects result from its use in the case of ovarian tumours, although I have frequently administered it for a lengthened period. On the whole, then, I would beg to advise you to be very chary of the administration of drugs, and especially of strong and heroic drugs, in cases of multilocular ovarian dropsy. One of the great, and, let me add, difficult lessons, which you will have to learn when you come to practise—is to know when to stay and withhold your hand, and

to keep yourself from injuring your patient by over-confidence in medicine, and by the too great use of physic. In the case of ovarian disease, patients will often urgently demand of you some remedy to dissolve their tumour; and if you, in compliance with their request, or believing any drug to be possessed of such a solvent power, begin to administer a quantity of drugs, you may often do harm instead of good. A tumour, which might have remained of moderate size, and proved a source of but remote danger to a patient, may be stirred up into active development and growth, and speedily come to be a source of danger and distress in consequence of an injudicious attempt to promote its absorption by the use of remedies calculated to act injuriously on the patient's general health. I would, therefore, advise you always to be well assured of the necessity of interference before you proceed to subject a patient with ovarian dropsy to any special kind of Medical treatment. In the way of this treatment, perhaps, the only indications which you will be called on to fulfil are the following:—

1. *Keep up the Standard of Health.*—To maintain the general health and strength of the patient at the highest possible standard, you may require to regulate her diet and general hygiene, and may deem it proper to give tonics and other kinds of remedies. But in administering drugs of any kind you must always bear in mind that you do so only with a view to the patient's general condition, and with the certainty that in keeping up her strength you do all that can usually be effected to retard or prevent the growth of the tumour and to protect her from the dangers of its enlargement.

2. *Alleviate Symptoms due to the Pressure and Presence of the Tumour.*—The tumour, especially in its earlier stages, sometimes presses on the rectum, and the bowels are apt to get constipated; or it presses on the bladder and causes dysuria, or retention of urine. Hence you will require occasionally to administer aperients, or to order an enema, and to prescribe some sedative mixture, or soothing application; or introduce the catheter. When the limbs begin to swell and become cedematous from the pressure of the tumour on the abdominal vessels, you will be called on to give diuretics to promote the resorption and elimination of the anasarcaous fluid. Vomiting, and all other mechanical and functional symptoms, must in like manner, be, as far as possible, counteracted and subdued, by means of the appropriate remedies. Occasionally when an ovarian tumour has ascended into the cavity of the abdomen, and its pedicle has become much elongated, so as to permit to the tumour a considerable freedom of motion, it causes distress and discomfort to the patient, by constantly rolling about from side to side in the abdomen, and producing compression, now of one organ, and again of another, according to the position assumed by the patient. To relieve this disagreeable symptom, all that you may require is to endeavour to fix the tumour; and this you can in most cases accomplish by making the patient wear a plain elastic abdominal belt, such as is furnished by most surgical-instrument and bandage makers; or the patient may make a simple binder for herself that will suffice to keep the tumour fixed in one position. I have already told you that when an ovarian tumour has attained a certain size, it almost always passes gradually, and of its own accord, upwards out of the small hard-walled cavity of the pelvis into the roomy and distensible abdominal cavity. But it happens occasionally, though certainly very rarely, that the tumour gets impacted in the cavity of the pelvis after it has attained such a size as to fill up all the available space in it; and as it goes on growing in this position, you can readily understand what an amount of suffering it will, in such a case, occasionally cause to the patient from the pressure it exerts on the surrounding soft parts. The distress experienced in such a case is much greater than that produced by the pressure of the normal gravid uterus; for, in truth, it exactly imitates the effects of a pregnant uterus, retroverted, and impacted below the brim and within the cavity of the pelvis. It is relieved also in the same way; for by exerting with your fingers adequate and steady pressure on the tumour, through the back wall and roof of the vagina, you can usually push the ovarian mass upwards into the abdominal cavity, into which it should have already mounted; and then the relief which the patient feels, is so instantaneous and complete, that she will be ready to believe that you have wrought a miracle upon her, and that she has been suddenly cured. You know, however, that such is not the case, that

she has only obtained relief from her immediately urgent symptoms, and that betimes the tumour will again make her aware of its existence, and lead to the production of a series of other symptoms, which it will be infinitely more difficult to subdue or control.

3. *Subdue Local Inflammation when it occurs.*—Perhaps the only other indication that remains to be fulfilled in the way of Medical treatment, is to put in use all the various antiphlogistic measures with which you are acquainted, for subduing inflammation when it arises in the wall of the cyst; and for counteracting the effects of such inflammation, when it has gone on to some of its higher grades. It is rarely that you find inflammation taking place in the interior of an ovarian cyst, until some operation has been undertaken for the cure of the disease. Yet, even in cysts which are tapped for the first time, we sometimes find the fluid that escapes turbid from the admixture of matters evidently of inflammatory origin; and if the patient's history be inquired into, we can usually make out that at one period or another, from the time when she first noticed the tumour, she had had occasional shiverings, and pain in the abdomen, and that sometimes also she had suffered from profuse perspirations. Most frequently, all symptoms of inflammation occurring in the interior of an unruptured and unopened cyst pass unnoticed; and when patients come to you with cystic ovarian tumours, complaining of pain and other symptoms of inflammation in the tumour, you will usually be justified in concluding that the morbid process is taking place not in the interior of any cyst, but on the external peritoneal surface of the growth. So long as such tumours are of moderate size, they usually roll about freely in the abdominal cavity, and show no great tendency to become the seat of any inflammatory process. In some patients, however, even when the tumour is still comparatively small, there seems to be a tendency to the occurrence of inflammation on its peritoneal surface; and if this morbid action goes on unchecked, the peritoneal covering of the tumour becomes, in circumscribed patches, the seat of adhesions between the outer surface of the cyst and the abdominal wall or viscera. Whenever, therefore, you find decided symptoms of inflammation occurring in an ovarian tumour, it becomes a duty of the greatest importance at once to endeavour to check the process, and prevent it, if possible, from going so far as to lead to the production of adhesions without, or pus within, the tumour.

This, then, is all, or nearly all, that can be effected in the way of Medical treatment in any case of ovarian disease. A cure of the disease from absorption of the tumour induced by any kind of remedial agency, is an event which you can never, I believe, trust to. You employ internal remedies only to keep up the patient's strength, or to palliate special symptoms. To bring about either a palliative or radical cure of the disease, you must have recourse, sooner or later, to some form of Surgical treatment. But I must postpone till another occasion the discussion of that important subject, and then inquire with you what prospects Surgery offers on this point. I regret, only, that these prospects are not of a brighter and happier tint than I shall have occasion to picture them to you.

SURGICAL SOCIETY OF IRELAND.—The first meeting of the above Society for the Session 1859-60, was held in the new Examination Hall of the Royal College of Surgeons, Dublin, the President of the College, Dr. Fleming, in the chair. After a brief address by the President, interesting communications were made by Mr. Croly, Dr. Johns, and Dr. MacSwiney.

THE ROYAL SOCIETY OF EDINBURGH AND THE NEILL MEDAL.—At the opening meeting, on 5th inst., for session 1859-60, of the Royal Society of Edinburgh, the Neill Medal and Prize was presented, through Professor Balfour, to W. Lauder Lindsay, M.D., F.L.S., for his "Memoir on the Spermatogones and Pycnides of Filamentous, Fruticulose, and Foliaceous Lichens," read to the Society during the last Session. In addition to awarding this prize, the Society is expending a considerable sum in publishing the memoir in question in the forthcoming part of its "Transactions," (Vol. xxii.) and in engraving the relative illustrations, executed by the author, which consist of twelve plates of between 400 and 500 drawings.

ORIGINAL COMMUNICATIONS.

CASE OF POISONING BY ATROPINE.

By C. HOLTHOUSE, F.R.C.S.

Surgeon to the Westminster Hospital, etc.

As a pendant to the interesting cases of poisoning by belladonna berries, published in the last number but one of the *Medical Times and Gazette*, I forward you the notes of the following case of poisoning by a solution of atropine, which happened to one of my own children.

At nine o'clock on Sunday morning, the 17th of last July, my second child, a hearty little boy, 3 years and 8 months old, was brought to my bedroom by the nurse, who said she did not know what was the matter with him, but he seemed very giddy, and could not stand. I had never seen a case of belladonna poisoning before, and the bedroom blinds being down, I did not at first notice the state of the child's pupils, or recognise the source of the symptoms; while all that could be gathered from the nurse was, that hearing what she supposed to be quarrelling between him and his brother, who were alone together in the breakfast-room awaiting our assembling at breakfast, she took him into the kitchen, and on setting him on his feet he fell down; she lifted him up, and told him to run along, but he again fell, and appeared to have no power of standing. On observing this, she immediately brought him up to me.

His face was at this time flushed and mottled with white, his eyes brilliant, and his manner and appearance altogether very strange and excited, while the expression of his countenance was quite maniacal. He was evidently unconscious, and very irritable, striking his mother when she took him from the nurse. On placing him on the bed he immediately began to pick at the bedclothes, and to grasp at imaginary objects. About five minutes afterwards, the nurse returned with two bottles, which my eldest boy told her his brother had been playing with. One of these, a half-ounce stoppered bottle, which was quite empty, I immediately recognised as the one in which I kept a solution of atropine, of the strength of two grains to the ounce, and which the day before had contained from a drachm and a-half to two drachms of the solution, the bottle being not quite half full. The cause of the symptoms was now but too apparent: I rushed with the child to the window, and the fully dilated pupils at once confirmed my suspicion. Dr. Fincham was now sent for, but long before his arrival, and in about five minutes after the discovery, I administered twenty grains of the sulphate of zinc, and on the arrival of the Doctor some mustard and water was also given; but three quarters of an hour elapsed from the giving the sulphate of zinc before vomiting took place. The quantity of fluid expelled did not exceed that given with the zinc, which was ejected by one effort, and no subsequent retching could be produced by mustard and water.

It deserves mention that a little of the fluid the child vomited, too small to excite notice at the time, accidentally entered my eye, which within an hour of the time had fully dilated the pupil. As no more vomiting could be excited, and it seemed probable that all the poison which was not absorbed had been ejected, stimulants were had recourse to, viz. brandy and water, ether, and ammonia, one or other of which were given every quarter of an hour; there was, however, great difficulty in getting the child to swallow, each attempt to do so producing paroxysms of suffocation, which appeared to threaten his existence; a good deal of what was put in the mouth was thus wasted. During the whole of this time till one o'clock, p.m. the child was insensible, the pupils were widely dilated and immovable, the eyes open, and the lids not winking on passing the finger in front of them; there was occasional jactitation, the skin was pungently hot and dry, and covered with a rash closely resembling that of scarlatina, which the child was frequently scratching: the pulse was 170, and somewhat feeble.

From one to two p.m., brandy and milk was given from time to time; an enema of two drachms of spirit of turpentine, an equal quantity of castor-oil, and six ounces of gruel, was also administered, and brought away a small quantity of fæces. He vomited once during this period, and was evidently

becoming more conscious; he made efforts to speak, and said "papa;" his face was less red, and the expression more natural.

From two to five p.m.—The symptoms during this period exactly resembled those of delirium tremens. There was incessant rambling delirium, great restlessness, a grasping at imaginary objects, and occasional screaming from fright. The character of the delirium varied; sometimes the child saw objects which frightened him, and the utmost terror was depicted on his countenance, and he clung to his nurse's neck, or threw himself violently in different directions, as if to escape them; this kind of delirium prevailed chiefly at the beginning of this period; towards the latter half, the delusions were of a more pleasurable kind, his talking was more intelligible, he mentioned the names of his brothers, his nurse, and "mamma," and grasped at his toys, as his whistle, which he blew in imagination; and he drew imaginary sketches with his pencil, and was very busy two or three times in putting into his mouth and eating imaginary currants, etc.

A mixture of egg and brandy, with milk and sugar, was given him at short intervals, and just before five he was sick for the third time (a portion of the fluid so ejected was saved for analysis). After this he fell into a quiet sleep, and so remained till 6 p.m., his pulse having fallen to 144, his skin being still hot, but not so red.

From six to seven p.m.—Great restlessness and returning consciousness characterised this period; he recognised me by my voice, kissed me, and jumped out of bed, and said he wanted to ride on my shoulders—an amusement he was occasionally indulged in. The skin was less hot and red, and there was very little delirium. He refused to take any kind of food or drink.

From seven to eight p.m. there was less restlessness, and when quiet he sucked his thumb (a habit he always indulged in when well), he sneezed and rubbed his nose frequently; consciousness increasing, but intermittent; he recognised my watch, put it to his ear, and remarked, "It's ticking;" but on giving it to him again a minute afterwards, it was not recognised, and he put it in his mouth.

From eight to ten p.m. there was more restlessness than for the last hour or two, and a constant motion of the hands to the mouth, as though eating something. Taking advantage of this action, a small piece of bread-and-butter was put in his hand, which he ate greedily; but there was a difficulty in getting him to drink. He talked frequently about persons and things which he fancied were before him. At a quarter to ten his bowels were moved, the evacuation smelling strongly of turpentine; he also passed water for the first time. A powder, which was ordered by Dr. Fincham, containing two grains of calomel, and five of jalap, was now given him.

From ten to twelve p.m. he lay on the bed tolerably quiet; he winks a little when the candle is put close to his face, but he sees nothing else; he has just said, "I can't see Mamma." At a quarter past eleven he took, with some difficulty, a saline mixture ordered by Dr. Fincham, after which his bowels acted to a greater extent than before, and he also passed water again (both saved for analysis). When his mother lay down on the bed beside him, he raised himself voluntarily, and kissed her twice. At midnight he took a little milk and brandy, and fell into a quiet sleep.

July 18.—From twelve to two a.m.—He slept quietly till a quarter-past one, when he awoke, and, before he could be raised in the bed, he had a violent and somewhat copious motion of a watery character. After this he took a small quantity of milk, and a teaspoonful of brandy, with some resistance; put his thumb in his mouth, and again went to sleep.

From two to four a.m.—He slept very quietly till four, when his bowels were again moved slightly, and he made water also (saved for analysis). Though his pupils are as much dilated as ever, he can now distinguish objects, for he told his mother he could see her; and he also took a cup of milk from her hand, and a little bread-and-butter. A dose of the saline mixture was also given him, which he would not take without the usual resistance.

From four to eight a.m.—He slept peacefully the whole of this time, lying on his back with his eyes and lips a little apart, and awoke well. He remarked that he could "see gan-mamma" over the chimney, (a photograph of his grandmother,) and he ate with evident relish a basinful of

bread-and-milk. As the morning advanced he said, more than once, that he wanted to have his clothes on, and before he was dressed he was running about the room in his night-gown, playing with his toys. His difficulty in seeing small objects, which were near him, was now the most prominent feature remaining of his illness; and his attempts to make out the letters of a newspaper which happened to be in the room, putting the paper first in one position and then in another, and eventually throwing it from him in disgust, were highly amusing. The dilatation of the pupils gave his face a singular expression, and they did not recover their normal size and movements for nearly a week.

It will be seen by the above notes that some of the fluid vomited just before five p.m., which was the third and last time the child was sick, and also some of the alvine dejections and urine voided at half-past eleven p.m., and at four a.m. (mixed together) were saved for analysis. Having submitted the same to Dr. Marcet, that gentleman very kindly furnished me with the following report:—

"Laboratory, Westminster Hospital, July 22, 1859.

"My dear Holthouse,—I received from you on the 18th instant the following—

"1st. A six ounce bottle containing $5\frac{1}{2}$ ounces of a mixture of urine and nearly liquid fæces.

"2nd. A second bottle smaller than the last, and containing about one and a half drachms of a colourless fluid, which you stated to have been vomited.

"3rd. and 4th. Bottles containing matters not connected with this case.

"The result of the examination of these various substances was as follows:—

"1st. The mixture of urine and fæces yielded to analysis a fluid which by direct contact with the eyeball, dilated considerably the pupils of a white mouse, without, however, exerting on the animal any other physiological action: It contained, therefore, a very small quantity of atropine.

"2nd. The vomited fluid yielded to analysis by the same physiological test, the presence of a trace of atropine, inasmuch as it also dilated the pupils of a white mouse, although not so readily as in the preceding case.

"Yours very truly, W. MARCET."

A CASE OF A PIN IN THE MIDDLE EAR.

By JOHN ROBERT KEALY, M.R.C.S. Eng., L.S.A.

Fellow of the Obstetrical Society of London.

ALTHOUGH I have consulted several works, I have been unable to find among the literature of the subject, a case like the following; and therefore think it may be a valuable addendum to future aural literature.

About six o'clock on a Monday evening in last month, I was requested to attend immediately at the house of Mr. —, one of whose daughters, aged 19, had, while at the toilette-table, put a pin into her left ear to relieve an intolerable itching. Her fingers being wet, the pin escaped her hold, and in order to get it out she pushed her little finger into the ear, and so made bad worse.

I found the parts about the meatus excessively tender; and she being of an hysterical temperament, the examination of the ear was extremely difficult. Having failed to discover the pin, and wishing to get rid of the cerumen, I used an ear-syringe. Without my asking her the question, she informed me that the liquid was passing into her throat; thus showing the membrana tympani to be perforated. There was sharp, pricking pain between the mastoid process and ramus of the jaw. I prescribed for her generally and topically, and at a subsequent visit determined to wait the result by the morning. About eight o'clock on Tuesday morning I visited my patient; found she had had a restless night, with increased pain and a stronger sensation of pricking on the left side of the throat. Hoping the pin was finding the point of exit, I directed her how to manage in order to secure it should she have the opportunity. I left for breakfast, but in a few minutes was quickly summoned to attend. On entering the room, the

astonished friends produced the pin, of the size and angle indicated by my sketch. It seems that, acting upon my

instructions, she got her nail round the head of the pin; this

excited reflex action, so that in an effort at retching, out came the pin, to the sufferer's marvellous delight. The throat was somewhat inflamed, and a small quantity of blood was discernible. A gargle was ordered, and a continuance of the treatment. Next day symptoms of inflammatory action in the middle ear had increased, so that I was obliged to order leeches to be applied; these had the desired effect. Subsequently a blister was applied behind the ear, in order to relieve the continued pain.

September 12th.—Upon examination by means of the otoscope, I find the membrana tympani opaque, and posteriorly a depression, in which is a hole about the size of a pin. She hears my watch at a distance of about two inches.

The mother of my patient is deaf from loss of the membrana tympanorum; and not long since I attended another daughter, who became completely deaf from suppurative inflammation of the external meatus, but has now perfectly recovered her hearing.

Gosport.

ON DIABETIC CATARACT.

By JOHN F. FRANCE,

Ophthalmic Surgeon to Guy's Hospital, and Lecturer on Ophthalmic Surgery.

I BEG to offer, in confirmation of views recently propounded in this Journal and in the Ophthalmic Hospital Reports, some additional evidence relating to the above subject.

There may possibly exist scattered cursory notices of cataract in association with diabetes of earlier date, but Dr. McKenzie, of Glasgow, was, I believe, the first to indicate a connexion between these diseases. "I have in three instances," he says, speaking of the causes of cataract in 1840, "seen lenticular cataract attack women, of from 18 to 25, labouring under diabetes mellitus." "I have, also," he adds in 1854, "met with the same complication in males at a later period of life." So Dr. M. Duncan, of Edinburgh, in a foot-note at page 15 of his translation of "Braun on Uræmic Convulsions," recognises a similar relation in the sentence—"In diabetic patients there is a tendency to cataract." Dr. Duncan has favoured me, in a private letter, with the information that his remark was drawn forth by the singular coincidence of having three poor diabetic patients at one time, labouring simultaneously under cataract. Not being interested particularly in the subject, he, unfortunately, did not take further note respecting the latter disease; but the occurrence attests in a striking manner the connexion between the two maladies.

Valuable testimony to the same effect is afforded by Mr. Wilde, of Dublin, in a late communication to this periodical intended to impugn my observations (a). For, while controverting the proposition, that "According to the latter authority it would seem that there was a special disease of the lens set up in patients labouring under diabetes," he virtually confirms it by adding, "I have seen patients labouring under diabetes where cataract also existed;"—for reiterated examples of so peculiar a complication do establish the fact of connexion.

The accuracy of my description of these cases is disputed by the same author. On this point I will merely say, in the first place, that if the counter-statement is founded on two or three instances only, and those quoted from memory, they are insufficient grounds of objection; while, if on several, then at least they proportionately help to justify the obnoxious term "Diabetic Cataract," by raising the numerical frequency of the affection.

The distinctive characters which this class of cases presents, are, however, an after-question to that of recognising them as a class; and I would not attempt to dogmatise upon it, though entertaining a strong conviction, that the description I have given will be found in the main correct. It certainly applied to, or rather was drawn from, those examples which have fallen under my own special observation and care; it derives independent support from Mr. Walton's interesting case, in the *Medical Times and Gazette* of the 12th ult.; and is further corroborated by the following, not less interesting, which has since been communicated by the kindness of my friend Mr. Veasey, of Woburn.

(a) No. 492, December 3, p. 564.

He writes:—"Your remarks on cataract associated with diabetes, recall to mind a case resembling the general outline which you sketched in the Ophthalmic Hospital Reports." He then goes on to relate the history, of which the subjoined is an abstract. The patient was a poor married woman, aged 31, the mother of three children. Diabetes had existed for some time in an aggravated degree. Her countenance was worn and anxious, the eyes sunken, the lips and skin parched, the tongue dry and chapped, the breath sweet; yet the urinary disease had been disregarded until the sight began to fail. Both eyes were the seat of a soft, bulging cataract, and dilated pupil; but vision was still useful; there was no inflammation. Operation "was long delayed, and when at length keratonyxis was performed in the County Hospital, no impression appeared to have been made on the lens, and the corneal wound healed badly, leaving a weak eye. Three or four months after this operation the poor woman, now wholly blind, besought me to operate. The needle was introduced through the sclerotic, and a complete division readily effected. No inflammation ensued, and absorption was just perceptible, when constant sickness with general failure of power, precluded all further attempts, and that scanty vision which had returned was shrouded in death." It is evident that the disease in this case (related by a most intelligent practitioner), agreed closely with the typical character of diabetic cataract as observed by myself; and the unfavourable result of the first operation (though no doubt in a measure attributable to the advanced state of general cachexia, which the primary disease had induced), illustrates anew with what caution these cases should be approached in the way of operative procedure.

The marked concurrence of similar features in all the examples hitherto circumstantially recorded of this comparatively rare affection, points in no ambiguous manner to the general uniformity of the class. Guided by this indication, I was enabled in the last case narrated in the Ophthalmic Hospital Reports, to recognise its special character, and anticipate its cause, before any complaint of diabetic symptoms (which were afterwards conclusively proved) was made by the patient. Now, bearing these facts in mind, I cannot but conclude, that results thus deduced from cases noted and related in detail are entitled to, and will receive, greater weight in an inquiry of this nature, than a loose general contradiction, as in *ex cathedra*, from however respectable an authority. In actual practice, at least, it will be well to remember what seems to be ascertained with regard to diabetic cataract; and I may be permitted, in conclusion, to say, that the communication of any instances which may occur to the readers of these remarks, would be esteemed a favour by their author.

24, Bloomsbury-square.

FALSE ANEURISM OF THE RIGHT COMMON ILIAC ARTERY.

By CHARLES ROBERTS,
House-Surgeon to the York Dispensary.

Nov. 14.—I was called to visit at her own house Harriet B—, aged 23, single. Her face was pale and anæmic, and had a very painful expression. She was somewhat emaciated, and appeared several years older than the age she stated. Pulse 100, soft; tongue slightly furred. Bowels relaxed, and had been so for two or three days previously; catamenia present. She complained of severe pain in both hips and in the lumbar region. The only position in which she could lie was on the back with her knees drawn up. At this visit I made no examination of the abdomen beyond slight pressure with the hand, which gave her no inconvenience. There was a history of rheumatic fever two years ago, but there was no heart affection. Her recent history she refused to give, and all her friends knew about it, was, that she had been living in Manchester for several months past, but they did not know how. Her hands were delicate and had evidently not been used either for needlework or servants' work for a long time. Believing her pains to be those of chronic rheumatism, I prescribed iodide of potassium and decoction of bark—the diarrhoea having been first arrested by chalk mixture and opium.

16th.—Almost free from pain, was still lying on her back, with the knees drawn up.

18th.—In bed, lying in the same position as before. More

pain in the hips and back. Complained for the first time of pain in the abdomen, where, on examination, I found a tumour in the right lumbar and inguinal regions. The patient seemed hardly to be aware of its existence. She *thought* she had observed it for the first time two or three days before, but did not think it of sufficient importance to mention it to me. Her friends knew nothing about it. The swelling was hardly perceptible to the eye; it extended from about the middle of Poupart's ligament up to within an inch of the margin of the ribs; there was a distinct interval between it and the liver above. Its inner border was rounded and abrupt while in all other directions it was gradually lost in the neighbouring structures. It was hard and resisting and there was considerable tenderness on pressure. There was no pulsation, nor was any abnormal sound detected on applying the stethoscope. I felt so uncertain about the diagnosis, that I only prescribed four leeches to be applied to the tender part and a dose of castor-oil for the bowels. The next day, Nov. 19, Dr. Shann was kind enough to see the patient with me; nearly all the tenderness had disappeared, and she was tolerably comfortable. Dr. Shann thought the tumour was ovarian and probably inflammatory, and therefore prescribed small doses of mercury, and substituted the bromide for the iodide of potassium in my original prescription.

21st.—Almost free from pain, felt weak, tumour in all respects the same.

22nd.—At ten o'clock, p.m., I received a message that the patient was dying, and when I arrived at the house, a quarter of an hour later, I found the patient quite dead. I learnt that she had had a very comfortable day, and during the afternoon she had been up to have the bed made. She had conversed in her usual manner till within half-an-hour of her death. About that time she suddenly exclaimed, "O! my heart," fell back, and gradually sunk, without a struggle or speaking another word. Both the friends and the patient thought the tumour had been gradually increasing during the day, but I could not myself perceive any decided difference. I was quite at a loss to account for the sudden death, and was therefore allowed to make a partial post-mortem examination twenty-four hours after death.

The abdomen only was examined. On laying it open the ascending colon presented itself immediately to the right of the umbilicus. The peritoneum, extending from it, over the tumour, to the iliac fossa and upwards to the diaphragm, was dark from injected blood. On dividing it along the ridge of the tumour, the outer curve of the right kidney was laid bare, and under the kidney, and, indeed, in a great measure surrounding it, and extending quite up behind the liver to the diaphragm, and downwards to the brim of the true pelvis, was a large clot of blood of unequal consistence; the upper and deeper portions were firm, and held together by numerous bands of fibrin, but had no appearance of organisation. The superficial portion lying in the iliac fossa was quite recent. I estimated the whole clot as equivalent to about forty or fifty ounces of blood. I traced the aorta down to its division, and the right common iliac about an inch into the lower margin of the clot, where it appeared to terminate abruptly. I dissected the lower end of the artery up to very near the point where the other left off. There was not the slightest trace of an aneurismal sac. All the abdominal and pelvic organs appeared quite healthy.

Note.—I am conscious that this case loses much of its interest from its deficiencies in two important points, viz., a good history, and a careful dissection of the parts. I very much doubt, however, whether any amount of history could have availed, as the patient was so imperfectly acquainted with the tumour. As to the dissection, I was prevented from attempting greater minuteness by the frequent importunities of the friends, who every moment expected the arrival of a member of the family who had a very decided objection to the whole proceeding. It is exceedingly probable that some portion of the artery was continuous; but that the blood had come from an opening of some kind in the right common iliac there can be no doubt. The coats of all the arteries were very thin and soft, but I could observe no decided marks of disease.

York.

ON December 8, at Cambridge, the degree of M.D. was conferred upon John Anthony, of Caius College.

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

ST. BARTHOLOMEW'S HOSPITAL.

INJURY TO THE HEAD.—DEATH.—AUTOPSY.—
HÆMORRHAGE UPON THE BRAIN.

(Under the care of Mr. STANLEY.)

THE following case is chiefly of interest as showing the constant need for caution on the part of those who have to do with patients supposed to be insensible from drinking. Difficulties of diagnosis of the kind which it illustrates, are of very frequent occurrence, especially to Surgeons to the Police, and the resident Medical officers of our Hospitals. Practically, the rule should be always to give the patient the benefit of doubt, and to treat a drunken man who has had a fall or a blow, with all the care which would be given to one whose symptoms depended wholly upon an injury to the head.

John J., aged 39, a strong, well-built man. He was brought to St. Bartholomew's Hospital on the night of Nov. 3, and was reported "insensible from drink." On inquiry it was ascertained, however, that he had been knocked down in a drunken squabble, and that he struck his head in the fall. He had remained insensible, and had been laid aside in a corner of a room. This occurred between two and three o'clock. He is said also to have been kicked in the ribs. Between six and seven, when admitted, he was found to be quite insensible. His pupils were dilated, his pulse exceedingly small and feeble, his breathing laboured and stertorous. He died a few minutes after his removal to one of the Hospital wards.

Autopsy twenty hours after death.—At the posterior part of the right side of the head was a large, circular, ecchymosed patch, the size of a crown-piece, evidently the result of direct violence. The head being opened, there was found between the dura mater and the brain, and also between the hemispheres, about five or six ounces of dark coagulated venous blood. No fracture of the skull had occurred, the extravasation having resulted from the concussion of the blow.

FRACTURE OF THE SKULL.—OPERATION.—
DEATH.—AUTOPSY.

(Under the care of Mr. McWHINNIE.)

C. H., a young man of about 20 years of age, was admitted into St. Bartholomew's Hospital, on November 25, between one and two o'clock, a.m., having, it was stated, jumped out of a bedroom window two stories high.

On admission, it was evident that the head was the seat of injury, for although there was no external wound, yet the great swelling, and the feeling of fluctuation, clearly pointed to extravasation of blood beneath the scalp. In addition to this, there was hæmorrhage from the right nostril and from the left ear. His condition was that of complete coma, his pupils being dilated, and the irides insensible to light; his breathing stertorous and difficult; his pulse slow (at one time only 18 in the minute), full and laboured; voluntary motion and sensibility were entirely wanting, and, in addition to these symptoms, there was slight priapism.

Mr. McWhinnie was sent for, and on his arrival made an incision in the scalp, through which a considerable quantity of dark venous blood escaped; he then introduced his fingers beneath the scalp, and discovered a fracture extending in the line of the coronal suture completely across the calvarium. In two places one edge of the fracture overlapped, and seemed to depress the other edge, and Mr. McWhinnie determined to remove these overlapping portions. This was accomplished by means of Hey's saw, and at the same time the dura mater (which bulged upwards where the pieces of bone were removed, evidently from blood extravasated beneath it) was punctured, and gave exit to some dark venous blood. Immediately after the operation the pulse rose from 28 in the minute (which it had been just before) to 80, and at the same time, became less laboured. The other symptoms, however, were not relieved, the breathing being still stertorous and the pupils remaining dilated. From this time the patient

continued much in the same condition until his death, which took place the same morning, at eleven o'clock.

Post-mortem appearances twenty-four hours after death.—On removing the skull-cap, which, owing to an extensive fracture, involving its entire breadth along the line of the coronal suture, separated into two parts, a small quantity of liquid blood was found extravasated between it and the dura mater. On detaching that membrane, which was considerably contused in one spot, blood in larger quantity was found poured out over the whole surface of the brain, and the veins in that situation were intensely congested. The brain's surface was throughout entire, but in its substance numerous clots of blood were found, as also in all the ventricles. On the brain being removed, and the base of the skull denuded of its dura mater, a fracture was seen, continuous with the one involving the skull-cap, extending on the left side through the squamous and petrous portions of the temporal bone, and implicating part of the basilar process of the occipital bone; and on the right side passing through the squamous and mastoid portions of the temporal bone, and being lost in the right jugular fossa. In addition to this, the right half of the cribriform plate of the ethmoid bone was broken in two places.

We are indebted for the above notes to Mr. Francis Lloyd, and for those of the following case to Mr. Rogers, the House-Surgeons who had care of the respective patients.

FRACTURE OF THE BASE OF THE SKULL
AND FRACTURED RIB.—PLEURISY.—DELIRIUM.—
DEATH.—AUTOPSY.

(Under the care of Mr. STANLEY.)

John R., aged 20, a well-formed muscular man, admitted November 17. He was brought to the Surgery with the following history:—While standing in the street, he was placed between two carts, by one of which he was thrown some distance, and fell on his head, when the other cart passed over his chest. When admitted, he was apparently insensible, but could be roused, and gave his name; pulse 48. Blood was exuding from the right ear; the pupil of the right eye was dilated, and insensible to light—that of the left was contracted. He could move his legs. On examining the chest, it was discovered that the sternum projected very much, resembling the diseased condition known as pigeon-breast. The thorax on both sides was depressed, but most so on the right, and there was very little movement. On turning him on his side, the inferior angle of the scapula was found to be protruding through the skin. The swelling and tightness of the parts was so great, that replacement of the bone was impossible. There was also a lacerated wound on the inner side of the arm, from which venous blood was flowing. No fracture of the ribs could be detected.

November 18.—He has had a quiet night, and speaks when questioned. He states that he is in great pain. Blood no longer oozed from the ear, but a serous fluid. Mr. Stanley stated that there was probably partial fracture of the base of the skull, and that he had no doubt that the case would terminate fatally.

On the 20th a dose of five grains of calomel was given, and a poultice was applied to the scapula. The note taken states—"The inflammation about the scapula is very great, and sloughing of the integuments is commencing. The state of the mind, however, is better. He is quieter, and expresses himself as having less pain. The inflammation about the arm is increased, and the integument looks quite livid."

21st.—To-day fracture of a rib is detected. There is great pain in the chest, and a friction-sound is also heard. The pulse is 120. Twelve leeches were applied to the right side of the chest, and calomel was given every four hours. The side was also strapped with plaister to ensure rest. He, however, grew worse, and in the evening became delirious, and continued so during the whole night.

22nd.—More delirious; pulse feebler. He gradually sank, and died on November 23, six days after the injury.

Autopsy, thirty-six hours after death.—A fracture was found on each side of the base of the skull, extending from the mastoid portion of the temporal bone to the foramen magnum. On the right side there was also fracture in the anterior part of the petrous portion of the temporal bone into the sphenoidal fissure.

KING'S COLLEGE HOSPITAL.

OPERATION FOR THE RADICAL CURE OF
HERNIA.—DEATH.

(Under the care of Mr. FERGUSON.)

[Reported by Mr. MASON, House-Surgeon.]

J. B., aged 47, was admitted into King's College Hospital, under the care of Mr. Fergusson, on November 18. He is a healthy-looking man, and states that he has always had good health. He is a baker, and is accustomed to lift heavy weights. He says that from birth he has had a tumour in the right groin, which increased on his assuming the erect posture. He wore a truss up to the age of 14, and then considered that he was cured; on lifting a heavy load, however, about twenty years ago, the tumour reappeared, and has since gradually increased in size. He has also suffered, in a less degree, from an oblique inguinal hernia on the left side, and worn a truss for it; but about six months ago, upon using more than ordinary exertion, he found that a tumour the size of an orange, of a painful character, appeared in the left groin; this has gradually increased in size up to the time of his admission. On admission the patient has a cheerful expression of countenance, and makes little or no complaint. On examining the regions of the hernia, a tumour the size of a large cocoa-nut is seen on either side; this increases on coughing, and also on his assuming the erect posture, but disappears to a great extent on his lying down. When he is erect, the penis can with difficulty be seen; he has never suffered from constipation, and has had no symptom of strangulation. The bowels are regular, and the functions of the body are healthily performed. He complains of no pain.

The patient, harassed by the unwieldy heaviness of the scrotal mass, was anxious to have something done to effect a radical cure. Mr. Fergusson, therefore, proceeded to operate, on November 19th, in the following manner. The patient being narcotised by chloroform, a skin-deep incision, of about an inch in length, was made over the spermatic cord of the right side; the finger of the left hand was then introduced, and pushed up to the internal ring, carrying before it the subcutaneous structures; a needle, armed with a strong thread, was then passed up to the ring, guided by the finger, and was made to transfix the internal pillar; one end of the thread was drawn through and left free; the needle was now withdrawn, and the same steps adopted to transfix the external pillar, the needle being brought through the same opening in the skin; the ends were now tied over a boxwood pad, a bandage was applied, and the patient sent to bed.

November 21.—He has had a good night, probably owing to his having taken an opiate. Tongue slightly furred; pulse 112; has a sensation of nausea. No pain referred to the region of the wound.

22nd.—Has not slept so well, and complains very much of nausea; has had vomiting of what he has taken since yesterday. Pulse, 128; tongue rather cleaner. The bandage was removed to-day. He complains of no pain in the region of the hernia; no tenderness of the abdomen. Bowels opened this morning.

23rd.—To-day the patient seems much exhausted, and has passed a restless night. Pulse, 138; tongue dry and furred. The vomiting still continues, but to a less extent than yesterday; the skin is covered with cold perspiration.

24th.—The patient got weaker during the night, and died this morning at six o'clock. No post-mortem examination allowed.

SAMARITAN HOSPITAL.

TWO CASES OF OVARIOTOMY.

(Under the care of Mr. SPENCER WELLS.)

ABOUT two years ago, when commenting in these Reports on the difficulty of obtaining correct information as to the actual results of ovariectomy, we expressed our intention to report *all* the cases in which this operation was performed in the London Hospitals for a series of years. We trusted that the facts so accumulated would tend towards the settlement of the question so often and so warmly debated—"Is

ovariectomy justifiable?" Hitherto we have acted up to our intention, since it was expressed, and we believe every instance of ovariectomy in the London Hospitals will be found in these columns, with one single exception. In that case there were special reasons against publicity. The operation was performed in one of our large general hospitals. The case was a very favourable one. The operator was one of the best Surgeons and most dexterous manipulators in the metropolis. The operation was completed without difficulty, and everything seemed to be most promising, yet the patient died a day or two after the operation. Here then was supposed to be a very convincing argument in favour of the objectors to ovariectomy. It was urged that death very soon followed an operation performed in a favourable case under the most favourable circumstances. But the examination of the body revealed a cause of death which showed that this argument is certainly not supported by the case in question. A piece of sponge was found in the peritoneal cavity. This, of course, was a very painful thing for the operator, who had to consider, in publishing the case, not only his own feelings, but those of his assistants, and of the surviving relatives of the deceased. Any one who has performed this operation will understand far better than others how readily such an accident might happen. Assistants are busy with sponges; others are carefully keeping the edges of the wound together to prevent protrusion of intestine; and the more active and busy the assistants, the more likely is such an accident to occur. The operator is anxiously securing the peduncle, cutting away the cyst, and closing the wound; he has not noticed the slipping of a piece of sponge into the abdomen, which has been concealed by the intestines and at once kept back with them. The more likely such a deplorable accident is to occur, however, the more necessary is it to put the Profession on their guard, in order that it may not occur again, and that, if it should occur, the death should not be placed in the ordinary category of deaths after ovariectomy. With these remarks, rendered necessary to complete our statistics of this operation, we now report two cases—one successful, the other fatal—performed in the Samaritan Hospital. These two cases make up ten in which Mr. Spencer Wells has performed ovariectomy in this Hospital, with a result of seven recoveries and three deaths.

Case 1.—COMPOUND OVARIAN CYST.—
OVARIOTOMY.—RECOVERY.

[From notes by Dr. BLOOMENTHAL, Resident Medical Officer.]

W. M., aged 29, single, was sent to Mr. Spencer Wells by Dr. Jackson, of Barnsley, and admitted October 8, 1859.

History.—She says she was in good health until about a year ago, when she first felt pain in the right iliac region. This drew her attention to the part, and she noticed a swelling, which soon began to increase, and went on until her breathing was much impeded, and the abdomen greatly distended. The catamenia had always been regular, and normal in quantity, until about three months before admission when they ceased entirely. She was tapped about five weeks before admission, but only between two and three quarts of fluid escaped, and the distension was only slightly diminished.

State on Admission.—She was very pale, weak, and emaciated. The pulse was feeble, but the tongue was clean, and appetite good. There was a small bed-sore on the sacrum. The abdomen was distended by a large multilocular ovarian cyst. The circumference at the umbilicus was thirty-six inches, and the length, from symphysis pubes to ensiform cartilage, seventeen inches. It was decided on consultation to perform ovariectomy without delay.

Operation.—On October 12, chloroform having been administered, Mr. Wells removed the tumour by the small incision. He divided the abdominal parietes over the linea alba to the extent of about four inches midway between umbilicus and symphysis pubis, thus making an opening just large enough to admit his hand. Passing this all over the surface of the cyst, he broke down some extensive adhesions to the parietes, and then emptied several of the larger cysts through a large trocar, drawing them out one after the other as they were emptied. Some portions of semi-solid matter, and aggregations of small cysts were drawn out, and a short pedicle secured by a clamp, about an inch from the right side of the uterus. The left ovary was found to be healthy. The abdominal and pelvic cavities were carefully cleaned by sponging, two small vessels were secured by ligature, the clamp fixed

on the surface of the abdomen, and the wound accurately closed by deep and superficial wire sutures; four of the former being passed through the whole thickness of the parietes, including the peritoneum. The tumour consisted of a few large and a great number of small cysts filled with a viscid fluid, the whole weighing about forty-five pounds.

Progress after Operation.—It is unnecessary to follow the daily notes of this case, as for the first week it was one of gradual recovery. There was so little pain that no medicine was given either by mouth or rectum for the first four days. The pulse remained feeble, ranging from 80 to 100, and perspiration was very profuse. There was very little vomiting. Hot linseed poultices were kept to the abdomen, brandy and soda water, port wine, beef-tea, and the brandy and egg mixture of the Pharmacopœia, were given at short intervals. On two or three occasions, on the fifth and sixth days, when there was a little pain, twenty minims of laudanum in an ounce of water were thrown into the rectum. The bowels acted spontaneously on the fourth day. The clamp was removed on the same day, and the deep sutures. She went on remarkably well until the tenth day, when the wound was perfectly united, with the exception of a small depression at the lower part, where a small slough on the stump of the peduncle interposed. On wiping away this piece of slough very free hæmorrhage took place suddenly, and several ounces of blood were lost during ineffectual attempts to find the bleeding vessel. Mr. Wells then applied a saturated solution of the perchloride of iron in glycerine, which instantly arrested the hæmorrhage. She did not appear worse for the bleeding, but did not improve during the next three days, and on the fourth day the bleeding recurred. The clot formed by the perchloride had been loosened, and the hæmorrhage was rather alarming. On carefully wiping away all clot, Mr. Wells then discovered that the bleeding vessel was not in the peduncle, but was a small artery in the parietes which had apparently been wounded in passing the lowest suture. This was tied, and no further bleeding took place, but there was for some days rather a free discharge from the lower part of the wound of fetid sero-sanguinolent grumous fluid and broken-down clots of blood. She remained weak for some time and the bed-sore which she had before the operation increased and caused her a good deal of pain, but she gradually gained strength and left the Hospital in a very good state of health on the 7th inst. Dr. Jackson has since written to say that she bore the long railway journey to Barnsley very well, and was "in the enjoyment of capital health and spirits."

Case 2.—MULTILOCULAR OVARIAN TUMOUR.—TAPPED NINE TIMES.—OVARIOTOMY.—DEATH.

[From notes by Mr. PHILLIPS and Dr. BLOMENTHAL, Resident Medical Officers.]

J. B., aged 27, single, lady's-maid, was first admitted under Mr. Spencer Wells, July 15, 1859.

History.—About four years ago, after a severe fall, she first felt pain in the lower part of the left side of the abdomen. This lasted for about three months, and she was treated in Edinburgh under Professor Simpson. She was kept in bed six weeks and brought under the influence of mercury. At the end of three months the pain ceased, but a tumour about the size of an egg remained, and never afterwards disappeared. But it did not increase for about eighteen months, during which time she travelled abroad. About two years ago the enlargement began to increase, and she was admitted into the Hospital for Women, under Dr. Protheroe Smith, in June, 1858, while suffering from acute peritonitis. She was relieved and taken in a second time in August, 1858, with an attack of circumscribed peritonitis in the right side. The abdomen at this time was forty-six inches in circumference. After the cessation of inflammation, she was tapped, and twenty-four pounds of fluid removed. She was again admitted in January, 1859, and twenty-two pounds of fluid removed by tapping. In April, 1859, she was re-admitted, measuring forty-nine inches, and forty pounds of fluid were removed. After tapping it was observed that a "large solid mass occupied the left hypochondriac and hypogastric regions." This appears to have formed in a great measure since the first tapping. In June, 1859, she was tapped for the fourth time, thirty-seven pounds of fluid having been removed. On each occasion a few leeches and general treatment had preceded tapping, on account of symptoms of circumscribed peritonitis. For these particulars we are indebted to Dr. Protheroe Smith. On

admission to the Samaritan Hospital, July 15, 1859, she was much emaciated, the pulse was very feeble, and she suffered very much from distension of the abdomen, which was fifty-one inches in circumference at the umbilicus and twenty-five inches from symphysis pubis to ensiform cartilage. On the 17th, Mr. Wells tapped two cysts, and removed twenty-two pounds eight ounces from one, and ten pounds six ounces from the other. The large solid mass on the left side, before described, was then seen very distinctly, and she said it had grown very fast since the last tapping. She was most anxious to have it removed, but she was in so depressed a condition that she was sent to the country for a time, and re-admitted August 22. On the 25th Mr. Wells tapped, and removed twenty-nine pounds of fluid, and she was put upon quinine and generous diet. She again left the Hospital, but was in for the third time from the 3rd to the 26th of October having been tapped on the 15th, and thirty-six pounds of fluid removed.

She was admitted for the last time on November 16, suffering extremely from distension, but still in better general health than she had been on any former admission. On the 18th Mr. Wells tapped the two cysts he had tapped in July, and removed forty-one pounds ten ounces of fluid. She was then put upon a very nourishing diet, and as, notwithstanding rapid filling of the cysts, she seemed in as good a state of health as could reasonably be hoped for, and she was most anxious to be relieved of her sufferings, the propriety of acceding to her request was most carefully considered in two full consultations of the Medical staff, and it was agreed that Mr. Wells should operate on the 6th inst. She was then about the same size as when tapped three weeks before.

Operation.—Mr. Priestley administered chloroform. The Hospital staff were present, and Drs. Sims and Westmacott. Mr. Wells commenced by making an incision over the linea alba, midway between umbilicus and symphysis pubis, just large enough to admit his hand, intending to do no more if the adhesions proved to be very firm; but, as he found the greater portion of the surface of the cysts nearly free, and some adhesions at the anterior border of the solid portion yield readily before the hand, he determined to proceed, and emptied both cysts through a very large trocar. They were then drawn forward, and the wound enlarged up to the umbilicus. Some firm adhesions of the omentum to the upper and back part of the solid portion were then separated, and two or three small cysts burst during this part of the operation. The whole of the cysts and tumour were then drawn out of the abdominal cavity. The mass was attached to the left side of the uterus by a large broad peduncle, and in addition to this a thick vascular band of adhesion connected the lower part of the solid portion with the abdominal wall behind the sigmoid flexure of the colon. This band was divided by the écraseur. The peduncle was secured by a clamp, and the tumour removed. Two vessels which were bleeding freely, far back on the abdominal wall, having been opened in separating adhesions, were then secured by ligature, the pelvis and lumbar fossæ carefully sponged out, and the wound united by deep and superficial sutures of iron wire. A pad of lint and a flannel belt were then put on, and the patient placed in a warm bed. She remained very low for about an hour, when she rallied and began to complain of pain in the abdomen. Half a drachm of laudanum was thrown into the rectum, and the injection was repeated in an hour, but only twenty minims were then thrown up. Some brandy and soda-water were given, and a little port wine. She was very comfortable in the evening. The pulse about 90. There had been some vomiting, but it was not very troublesome. The skin was warm and moist, and she was in good spirits. She passed a very tolerable night; had two injections of twenty minims of laudanum when pain became troublesome; a moderate quantity of urine had been twice removed by the catheter. She had slept pretty well, and up to 10 a.m. on the day after operation seemed to be going on satisfactorily. She then began to sink rapidly, felt cold and faint, and the pulse became imperceptible, notwithstanding the free use of stimulants both by the mouth and rectum. She died twenty-three hours after operation.

The tumour consisted of two very large cysts, which contained upwards of forty pounds of fluid, and of a semi-solid mass of small cysts, which weighed eleven pounds and a-half. The whole removed, therefore, weighed about fifty-three pounds.

The abdomen was examined on the following day. The

wound was found to be united on its peritoneal aspect by recent lymph, with the exception of the spots where the peduncle passed below, and the ligatures on the vessels above. One loop of small intestine adhered by soft, recently-effused lymph to the wound for the extent of about an inch. The portion of omentum which had been separated from the cyst was slightly congested. There were between one and two pints of bloody serum in the peritoneal cavity, but not a morsel of clot. There were signs of peritonitis about the broad ligament on the left side, and on the parietes near the wound, and on two or three coils of intestine which lay near it; but there were no marks of general peritonitis. The ligatures did not appear to have set up peritonitis in their track. The uterus was normal. The right ovary was about the size of a large walnut, and nodulated on its surface. The peduncle, consisting of Fallopian tube and broad and round ligaments, was securely fixed by the clamp outside the wound.

Remarks.—This was one of those desperate cases where the Surgeon who looks to his own reputation as an operator whose results are numerically successful—or, less selfishly, to the credit of Surgery in general, or of ovariectomy in particular—would certainly refuse to operate. In a case where the probabilities are greatly against success an operator is not only likely to lose by a comparison with the results of others who only operate in favourable cases—but he may bring discredit on an operation, strengthen the belief in its excessive mortality, and deter other Surgeons from recommending it, or patients from submitting to it, where the conditions are hopeful. And it becomes a moral question of no small magnitude how far these considerations should prevail against the simple question,—“What is my duty to this patient?” It appears to us that if once the Surgeon is convinced that he ought not to allow any patient to go on through a life of suffering to an inevitable death, when there is a possibility that an operation may restore that patient to health, it is his duty to cast aside all other considerations, and do his best for the poor creature who has confided in him. Then, of course, come the important practical questions,—Is the disease necessarily fatal? Is an operation necessarily fatal? Is there a moderately fair chance of recovery? Does the patient fully understand the risk? Is suffering so great and life so irksome that she is anxious to be relieved even at so great a risk? All these questions were most anxiously considered in the above case, and, although the result has been unsuccessful, the mother of the patient, and those who knew her best and know what death by the natural progress of ovarian disease is, have a certain melancholy satisfaction in feeling that nothing has been left undone which might have been done, and that some weeks of hopeless, lingering suffering have been spared.

NOTES AND QUERIES.

Be that questioneth much shall learn much.—Bacon.

No. 393.—SYDENHAM AND HIS PIPE.

Dr. Sydenham, the celebrated physician, lived in Pall Mall from 1669 to 1689, when he died. He is buried in St. James's church. Mr. Fox told Mr. Rogers that Sydenham was sitting at his window looking on the Mall with his pipe in his mouth and a silver tankard before him, when a fellow made a snatch at the tankard and ran off with it. “Nor was he overtaken,” said Fox, “before he got among the bushes in Bond-street, and there they lost him.”—*Cunningham's “London.”*

No. 394.—WHAT IS GLANDULAR SECRETION?

SIR,—Will you allow me, through the medium of your valuable “Notes and Queries” to seek enlightenment upon a point of physiology about which I can obtain no satisfaction in any of the modern authorities I possess on this subject? We are taught, as a leading doctrine concerning secretion, that this act, like so many other vital acts, is one of cell-growth; that the cells are born, grow, come to maturity, burst, and discharge their contents. But we know in the case of the kidney it is admitted, that the watery parts of the urine pass off from the renal vessels by the simple physical act of transudation; and what I desire to know is, whether

this act of transudation takes place solely in the instance of the kidney? For instance, am I to believe that the fifteen or twenty ounces per day of saliva, of which physiologists speak, are the products solely of this cell-growth of the gland-cells of the salivary glands; that those comparatively small glands, the parotid, the submaxillary, and the sublingual, are capable of thus generating and so rapidly the enormous quantity of cells, which the quantity discharged, and so quickly discharged at one time, would indicate? When we consider the nature of this secretion, that it contains only one per cent. of solid water, and ninety-nine per cent. of water, is it not more reasonable to think that the great part of this water leaves the blood simply through transudation? Is it reasonable to think that such an immense growth of cell-life would be called into existence merely to discharge water, which so readily passes off by transudation, as in the case of the skin, the lungs, and the kidneys? But on this question, applied not only to this but to other glandular secretions, I can get no satisfaction. Is glandular secretion in all cases—or if not in all in what cases is it—an act partly vital, of cell-growth, and partly of transudation? This is the question about which I would most gladly hear an authority speak.—
I am, &c. ICH.

No. 395.—ANECDOTE OF JOHN HUNTER.

Dr. John Haviland, of Gundenham House, Somerset, previously to his retirement, practised for more than half-a-century in Bridgewater; he was intimate with John Hunter at one period of his long life, and in consequence, placed his only son under that celebrated physiologist. Hunter showed much kindness to his pupil, and Dr. Haviland was anxious to acknowledge it by sending him some delicacy from the country; he decided upon *laver* (*porphyra lanceolata*), and accordingly despatched to London a barrel of this esteemed confervall esculent, well-selected and in beautiful order. Hunter duly received the present, recognised his friend's handwriting, and opened the barrel; but no sooner did he behold the contents, than he pondered, wondered, and then boiled over. In his passion, he sent for young Haviland, whom he thus addressed:—“Sir, does your father mean to insult me? He has sent me a barrel of cow-dung, or some filth like it.” “Impossible, Sir,” answered the pupil, and added, “Perhaps, Sir, there is some mistake.” “Judge for yourself, young man,” said Hunter, placing with an indignant air the barrel of *laver* before him. Young Haviland saw at once the blunder of his master, and had much difficulty in restraining his laughter; for obvious reasons, however, he did not indulge himself, but gravely explained “that the contents of the barrel were considered a great delicacy in the West of England, and generally eaten with roast mutton.” Hunter was not convinced, and seemed half inclined to believe that the son was in league with the father. “Come and dine with me, Sir, to-morrow, off roast mutton, and recollect, I expect you to eat some of this damned mess with it!” The great John thought that he had settled the point; his pupil, however, was punctual, the *laver* had been cooked according to his directions, and, moreover, soon appeared to be a favourite sauce of the young Somersetshire man. John Hunter looked on in perfect amazement, and quite unmindful of his own dinner; at last, perceiving that his young friend's relish was genuine, he cried out, “Stop, stop, you Sir; don't you eat all that stuff yourself; damn it, let me taste a bit!” His guest accordingly helped him to a small spoonful, which he took with extreme caution; at last his eyes began to twinkle, he saw through his error, apologised for it, had a hearty laugh, and helped himself to the remainder, which he enjoyed amazingly, and ever after considered a barrel of *laver* the most acceptable present he could receive from the country.

No. 396.—A GOOD WORD FOR THE “DOCTORS.”

“Our Physicians are an exceedingly enlightened set of men—in my opinion incomparably the highest class in France. No other class knows so much, or so much of certain things. No other is so well formed in mind and character. But the rough and masculine education of their schools and hospitals, their hard Surgical initiation—one of the glories of this country—bring with them a serious fault. They tend to the extinguishing of that fine sensibility, which alone can perceive, anticipate, and divine things.”—*Michélet, “L'Amour.”*

SATURDAY, DECEMBER 17.

THE COLLEGE OF SURGEONS.

A COUNTRY wench who has committed an indiscretion, and finds the shadows of future troubles falling wider and deeper about her, is sometimes said "to be made an honest woman of" by hurrying through the marriage ceremony before she tumbles into bed. But even this cannot be done without certain preliminary formalities. The Rector must not forego the banns, nor the convenient Registrar his due notice. Neither the terrors of the parsonage, nor "the highly penal clauses" of the code of cottage discipline, make any difference. The curriculum of legitimacy is positive. But what would be said if our reverend Bishops, having in moments of weakness been betrayed into illicit flirtations in some obscure corners of their dioceses,—either out of compassion or compunction,—should contrive, by some mysterious "relaxation of their rules for a limited period," to slip the magic ring over the fingers they had been so indecorously toying with, in order to prevent "certain persons" from being, in the opinion of the Bench, "unjustly excluded from the Register"? Society would feel itself aggrieved. The disreputable conduct in the dark, and the unhallowed whitewashing of the intriguers afterwards, would be equally matter of reprobation.

Now, it is a fortnight since we pointed out to our readers the injustice of the course recently taken by the Council of the College of Surgeons in reference to the mode of admission of some of its new members. No one who looks at the relative position of all the parties interested will dispute this point. All must feel it, whether members of the College or of other corporations. We take no exception, however, to the grace extended to old Licentiates of the Company of Apothecaries, who, as everyone will allow, have not been smuggled into the Profession, but have freely complied with exactions even above the average,—have long ranked as General Practitioners, have used by courtesy the title of Surgeons without remonstrance, and at length find themselves somewhat hardly dealt with by the late enactment. But the dishonourable way in which other persons with "Surgical and general characters" have been coquetted with on their making advances to the Court of Examiners, the sly invitations to private conferences which they have been favoured with, and the indulgent laxity which has opened for them the door to legitimate refuge in the arms of the College from the pains and penalties of the Medical Act truly deserve exposure.

We are not detectives, and we know how odious a thing it is to point out blemishes where one would wish only to see unsullied purity. Still, no good is done by pretending ignorance when we know evil exists; and over-leniency towards wrong-doers is always unwise. Let blame fall where blame is due.

We have no wish to deal out general accusations, nor to use indiscriminately the language of invective. A plain

statement of facts is, nevertheless, due to those who place confidence in us, and who look to us to be informed of what may come to our knowledge that affects their interests. In doing this we shall not go beyond the cases which we have already made notorious. A person of the name of Horton, assistant to a Surgeon in the Dudley district, is now in possession of the diploma of the College of Surgeons, after nominal examination, and without having passed through any course of Medical education. Another, Mr. Meredith, who is a retail druggist, keeping an open shop in the same place, and is said to practise whenever he has the chance, has been in correspondence on the same subject with the officials of the College, and is now actually enrolled as a Member. Thus much our readers are already aware of. But they will be surprised to learn that as long ago as the early part of the month of September, the friends of Mr. Horton were assured by a letter from a member of the Board of Examiners that his claims were already recognised, and that he would be examined when an opportunity occurred. They will be indignantly astonished to be told further, that Mr. Meredith was asked from behind the counter to favour the same accommodating friend at Court with a call, at which matters were to be explained fully to him; that his anxieties were soothed by the welcome information that the examination in such cases as his did not include Anatomy and Physiology, and still less anything not strictly Professional, and that they were altogether of a simple and entirely practical character; that he was promised assistance, as far as possible, in the Court; that he was directed to bring with him any evidence he could produce of education; and was referred to two or three Surgeons, by name, whose testimonials, if they could be procured, were thought likely to enable him to pass muster.

Here are simple facts. There is treachery in the camp as well as in the court. Such conduct is beyond vindication. One need not aggravate the remorse which must follow deeds like these by harsh upbraidings. A sting is left that will do its work of punishment surely enough. Our public brand is not wanted. The wages of such sin is death:—death to the reputation, if confessed; a clinging, numbing, killing torpor and death to the moral sense, if held secret in the dark chambers of the heart.

THE WEEK.

THE Medical Act contains a provision, enabling Her Majesty, by charter, to grant to the Royal College of Surgeons of England power to institute and hold Examinations, for the purpose of testing the fitness of persons to practise as Dentists, who may be desirous of being so examined, and to grant certificates of such fitness. This enactment has its origin in a practice which has long prevailed in London, for persons to call themselves Surgeon-Dentists, without apparently having any authority for the assumption of such designations. A case of this kind came before the Lord Chief Justice of the Court of Common Pleas and a jury of the City of London last week. There the plaintiff sought to recover damages for two libels with reference to him as a Surgeon-Dentist, alleged to have been published by the defendant. The defendant had pleaded, that the plaintiff was not entitled by law to call himself by, or use, the title in question. In support of his case the plaintiff was examined, and stated that he was educated for a Surgeon-Dentist, and had obtained a diploma from the College of Dort, in Holland; that he came to England in 1847, and had since carried on the business of a Surgeon-Dentist. Another witness was also examined, for the plaintiff, who stated that he was a Doctor of Medicine, but not a Surgeon; that his diploma was from New York, and that he had likewise practised as a Surgeon-Dentist in London. Evidence was further given of the custom in London of Dentists, who were not Members of the Royal

College of Surgeons of England, assuming to themselves the title of "Surgeon-Dentists;" but one of the plaintiff's witnesses said, in his opinion, that this custom was not justifiable. When summing up the case to the jury, his Lordship said he should reserve for the Court above the question which had arisen, whether, under the Medical Act of 1858, the plaintiff had a right to call himself a Surgeon-Dentist, but he then left it for the jury to say whether the documents set out were libellous, and if so, what damages the plaintiff had sustained; whereupon the jury, after considering the matter for some time, found a verdict for the plaintiff, as to one of the alleged libels, with forty shillings damages, but for the defendant as to the other. Our readers will thus perceive, that the legality of the custom alleged has now been distinctly raised; and as the Court above will meet again early in January, the Profession may therefore speedily look for a legal decision upon this important question of Medical titles and designations.

At the last meeting of the Senate of the University of St. Andrews, the Honorary degree of Master of Arts was conferred on Dr. Benjamin W. Richardson. This is the third instance, we believe, in which the degree has been given by this University in recognition of general and scientific attainments. On both the preceding occasions a member of the Medical Profession was the recipient of the honour. Dr. Hannay, of Glasgow, who died about 1845, was the first Honorary M.A. He was for many years Examiner in Medicine at the University; he was one of the first to introduce Laennec's discovery of auscultation into this country; he was one of Laennec's pupils, and a friend. To him Hope dedicated his famous work on "Diseases of the Heart." The second gentleman on whom the degree was conferred was the late Dr. Golding Bird, who was a Medical Graduate of St. Andrew's, and whom we all remember. Dr. Richardson, the third Honorary Arts Graduate, graduated in Medicine at St. Andrew's in 1854. His Prize Essay, on the "Coagulation of the Blood," and other literary works, render his honorary degree an honour to the University.

The Rev. C. Kingsley has been lecturing on "The Rationale of Health." "To the Medical men of England and Germany," he said, "he owed a debt deeper than he was able to express. He had learned more science from them than he should be ever able to repay them, and also more morality, in a high sense, than he should ever be able to adequately acknowledge. Were he able to do his duty in his profession as he saw, not only the average, but the majority of Medical men doing theirs, he should be a happier man than he was now." He told his auditors that if the doctors had their wish they would strive most to keep the people in health, not merely to cure them when diseased. "A perfectly wise man, living in a perfectly wise state of civilisation, and taking perfectly wise care of himself, ought to be able to insure his health, by paying a Medical man so much a year for keeping himself in health, just as much as a man insured his body against accidents, or his house against fire. He would not say how many hundred years hence, but the time would come, when people would be found insuring their health for a certain number of years, or, at all events, for twelve months, by paying premiums to companies who would look after their health, and take care that they did not vitiate their bodies." Mr. Kingsley then directed attention to the mortality from preventible diseases among children. He told his auditors that *forty per cent.* of the children born in this country died before they reached five years of age. "He had witnessed the death of old men, and experienced no shock of horror, as they had trod life's path. He had seen many children die, and the sight always gave him a shock, and he felt

as if the world was out of joint. Why do they die? God had exercised as much creative power in making them so pure, so noble, and so graceful, and yet they were allowed to die so early! By man's fault, he would answer." Most earnestly did the lecturer point out the principal causes which concur in bringing about the mortality of early childhood, and he illustrated one point by examples derived from two families which he had seen. Both were kind and noble; both had children; but the one thrust its children into the small contracted rooms at the top of the house, while the best apartments were given to visitors; the other kept its children in the handsomest and most spacious rooms in the house, and said, "We cannot receive any visitors, or give any dinners, as our house is so small, and we are forced to give up the best rooms to our children." The children of the first family grew up stunted and miserable; the children of the latter family, fine, noble, and healthy. We are grateful to Mr. Kingsley for his admirable lecture, and we hope to see it published in a cheap form, and disseminated throughout the kingdom. With such co-operation as this given by Mr. Kingsley, what might not our Profession do?

PUBLIC VACCINATION.

INSTRUCTIONS FOR VACCINATORS UNDER CONTRACT.

1. Except there be immediate danger of small-pox, vaccinate only subjects who are in good health. Satisfy yourself that there is not any eruption behind the ears, or elsewhere on the skin; nor any febrile state; nor any irritation of the bowels. Under no circumstances vaccinate a subject to whom, from the state or prospects of his health, vaccination is likely to prove injurious. Do not revaccinate persons who in infancy have been efficiently vaccinated, unless they be more than 15 years of age, or, if during any immediate danger of small-pox, more than 12 years of age.

2. In all ordinary vaccinations, vaccinate by four or five separate punctures, so as to produce four or five separate good-sized vesicles; or, if you vaccinate otherwise than by separate punctures, take care to produce local effects equal to those just mentioned.

3. Direct care to be taken for keeping the vesicles uninjured during their progress, and for avoiding afterwards the premature removal of the crusts.

4. Register the results of vaccination only after having yourself inspected the cases. Register as "successful" no case of primary vaccination, unless the course of the vesicle have been strictly regular according to the subjoined description, A; and register as "successful" no case of revaccination, unless either the regular vaccine vesicle have ensued, or the results have been normally modified according to the subjoined description, B. Or if in either case you register as "successful" any result which does not agree with the subjoined descriptions, write also the word "irregular" in the column of the register where you record the result.

5. Endeavour to maintain in your district such a succession of cases as will enable you uniformly to vaccinate with liquid lymph directly from arm to arm; and do not, under ordinary circumstances, adopt any other method of vaccinating. To provide against emergencies, always have in reserve some stored lymph,—either dry, as on thickly-charged ivory points, constantly well-protected from damp; or liquid, according to the method of Dr. Husband of Edinburgh, in fine, short, uniformly capillary (not bulbed) tubes, hermetically sealed at both extremities. Lymph, successfully preserved by either of these methods, may be used without definite restriction as to time; but with all stored lymph caution is necessary, lest in time it have become inert, or otherwise unfit for use. If, in order to vaccinate with recent liquid lymph, you convey it from case to case in a vial or in other like manner, without its being hermetically sealed, do not let more than eighteen hours, and in very hot weather not more than twelve hours, intervene before it is used.

6. Consider yourself strictly responsible for the quality of whatever lymph you use or furnish for vaccination. Take

lymph only from subjects who are in good health; especially satisfying yourself that they are free from eruption on the skin. Take it only from well-characterised, uninjured vesicles. Do not take it from cases of re-vaccination. Take it (as may be done in all regular cases on the day week after vaccination) at a time when the vesicles are plump, either just before the formation of the areola, or, at the latest, not more than twenty-four hours after the areola has begun to form.

7. In vaccinating from arm to arm, and still more in proceeding to store lymph, avoid draining any vesicle which you puncture. From such a vesicle as vaccination by puncture commonly produces, do not, under ordinary circumstances, take more lymph than will suffice for the immediate vaccination of five subjects, or for the charging of seven ivory points, or for the filling of three capillary tubes; and from larger or smaller vesicles take only in like proportion to their size.

8. Scrupulously observe in your inspections every sign which tests the efficiency and purity of your lymph. Note any case wherein the vaccine vesicle is unduly hastened or otherwise irregular in its development, or wherein any undue local irritation arises, and if similar results ensue in other cases vaccinated with the same lymph, desist at once from employing it.

9. If from any cause your supply of lymph ceases, or becomes unsuitable for further use, take immediate measures for obtaining a new supply.

10. Keep in good condition the lancets or other instruments which you use for vaccinating, and do not use them for other Surgical operations.

N.B. Supplies of lymph, guaranteed by the National Vaccine Board, are furnished, on application, to all Medical Practitioners. Letters of application for this lymph should be addressed "To the Registrar of the National Vaccine Establishment, Privy Council Office, London, S.W."

SIGNS OF SUCCESSFUL VACCINATION AND OF SUCCESSFUL REVACCINATION.

(Gregory, revised by Ceely and Marson.)

A. "When vaccination has been successfully performed on a healthy infant, the puncture may be felt elevated on the second or third day; and soon afterwards, if examined with a magnifying glass, appears surrounded with a slight redness. On the fifth or sixth day a distinct vesicle is formed, having an elevated edge and depressed centre. On the eighth day it appears distended with a clear lymph. The vesicle, on this, its day of greatest perfection, is circular and pearl-coloured; its margin is turgid, firm, shining, and wheel-shaped. Late on the seventh, or early on the eighth day, an inflamed ring or areola begins to form around the base of the vesicle, and, with it, continues to increase during the two following days. This areola is of a circular form, and its diameter extends from one to three inches. When at its height, on the ninth or tenth day, there is often considerable hardness and swelling of the subjacent cellular membrane. On the tenth or eleventh day the areola begins to subside, leaving, as it fades, two or three concentric circles of redness. The vesicle now begins to dry in the centre, and acquires there a brownish colour. The lymph which remains becomes opaque, and gradually concretes; so that about the fourteenth or fifteenth day the vesicle is converted into a hard round scab of a reddish-brown colour. This scab contracts, dries, blackens, and about the twenty-first day, falls off. It leaves a cicatrix which commonly is permanent in after life, circular, somewhat depressed, dotted or indented with minute pits, and, in some instances, radiated. The above described local changes, while in active progress, are attended by feverishness; first, from the fifth to the seventh day, so slightly that often the fact passes unobserved; and again more considerably during those days when the areola is about its height; the infant now being restless and hot, with more or less disturbance of the stomach and bowels. About the same time, especially if the weather be hot, children of full habit not infrequently show on the extremities, and less copiously on the trunk, a lichenous, roseolar or vesicular eruption, which commonly continues for about a week. When vaccination is performed on such adults or adolescents as have not previously been vaccinated, and likewise when lymph is employed which has recently been derived from the cow, the resulting phenomena, as compared with the preceding description, are somewhat retarded in their course; and the areola is apt to be much

more diffuse. There is also more feverishness; but eruption is less frequently seen."

B. "When persons who have once been efficiently vaccinated are, some years afterwards, re-vaccinated with effective lymph, there sometimes result vesicles which, as regards their course and that of the attendant areolæ, cannot be distinguished from the perfect results of primary vaccination. But far more usually the results are more or less modified by the influence of such previous vaccination. Often no true vesicles form, but merely papular elevations surrounded by areolæ; and these results having attained their maximum on or before the fifth day, afterwards quickly decline. Or if vesicles form, their shape is apt to vary from that of the regular vesicle, and their course to be more rapid; so that their maturity is reached on or before the sixth day, their areolæ decline on or before the eighth day, and their scabbing begins correspondingly early. In either case the areolæ tend to diffuse themselves more widely and less regularly, and with more affection of the cellular membrane, than in primary vaccination; and the local changes are accompanied by much itching, often by some irritation of the axillary glands, and in some cases on the fourth or fifth day by considerable febrile disturbance."

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE EPIDEMIC OF VARIOLA IN THE CANTON OF GENEVA IN 1858-59.

By M. MARC D'ESPINE.

THE following is the summing up of M. Marc D'Espine's elaborate memoir:—

The epidemic of 1858-9 has been by far the most severe of all those which have visited the Canton since the introduction of vaccination. It attacked 21 individuals in 1000 inhabitants, and gave rise to 2·3 deaths, one-half of these depending upon a hæmorrhagic cause. There are probably few of the countries of Europe which have been recently visited by this disease that have paid so large a tribute to it as the Canton of Geneva. The mortality has been 10·8 per 100 cases—45 per cent. in the non-vaccinated and 9·5 per cent. in the vaccinated. How considerable this proportion is may be judged by the results of the inquiry instituted by the London Epidemiological Society, from which it resulted that the mortality in different countries of Europe oscillated between 0 and 12 per cent. in the vaccinated, and between 15 and 53 per cent. in the non-vaccinated. This great mortality of Geneva, exceeding that of any other locality or town situated in the basin of the lake, is explicable by the large number of cases of hæmorrhagic variola.

Complete unanimity exists among the documents furnished upon the Genevese epidemic, and those derived from other countries as to the greater liability of males. The relation is four to seven females for ten males, according to the epidemics or localities.

The *Elective Age* of natural variola is childhood and infancy. In countries in which vaccination is but little—or not at all—practised, variola attacks but few adults; but in proportion as a population has been more generally, and for a longer period, submitted to the vaccine influence, variola attacks a larger proportion of the older vaccinated, and spares children protected still by recent vaccination. In those countries in which nearly the whole of the new-born infants have been vaccinated for a long time past, it is from the twentieth to the twenty-fifth year, that variola attacks most of its subjects; children below ten years being rarely affected.

Revaccination, made at opportune periods, greatly increases the chances of preservation, and evidently alleviates the disease in those individuals whom it has not been able to secure against the attack. It seldom succeeds in producing satisfactory pustules until after ten years of age. On this account, then, and because the first vaccination affords sufficient protection at least until 10 years, it is at about from the 12th to the 15th year that the first revaccination should be performed. A second may be resorted to at about the age of 30; but this is of less consequence than the first, inasmuch as the examination of facts show that the chance of contracting variola diminishes much after the age of 30. Nevertheless, just

as the more general practice of vaccination has transposed the age of the maximum of frequency of variola from infancy to the 15th, 20th, or even the 25th year, a generalisation of the practice of revaccination at about the 12th or 15th year, may thrust back this maximum beyond 30 years; and we may predict that with the progress of primary vaccination, a second towards the 30th, and even a third towards the 40th year, may one day become requisite. Vaccination or revaccination, practised even at the height of an epidemic, when complicated by an immediate invasion of the variola, neither modifies the progress of this, nor is itself modified by it. We may therefore vaccinate during an epidemic with impunity.

It would seem that a first variola preserves somewhat more certainly from variola than a first vaccination; but that if variola does supervene, that which is secondary is more fatal than is the varioloid following vaccination.

Cow-pock appears to succeed somewhat better than the chain of Jennerian virus, both as a prophylactic, and as to the pustules it gives rise to; but virus passed from man to the cow, and then from the animal to man, derives no advantage from such passage.

Epidemic Variola attacks preferentially the strong and healthy portion of a population, rarely following an acute disease, or complicating a chronic diathesis. Pregnancy and alcoholism are two conditions in which variola is found oftener arising than in disease properly so called; but the prognosis is far more favourable in variola occurring in a state of health, or in the course of a normal pregnancy, than among persons seized under different conditions. The disease is especially fatal among those who have committed abuses of alcoholic drinks.

The epidemic of the Canton of Geneva, and of other districts situated in the basin of the lake, has furnished in every hundred cases of the disease sixty or seventy cases of direct and slight variola, and from thirty to forty cases of confluent or dangerous variola. Intense prodromes were not always followed by the dangerous form of the disease, but slight prodromes were always succeeded by a slight and benign form. Suppurative fever was manifested in the majority of the unvaccinated and in 5 per cent. of the vaccinated. Some instances of confluent variolous eruption, strictly limited to the face, were noted during the epidemic, and cases of *variola sine variolis*, few in number in Geneva itself, were met with in more abundance in other localities.

The hæmorrhagic form was manifested at all the points of the basin of the lake at which the variola appeared, but with varying frequency in different localities. The Canton of Geneva exhibited the largest proportion, 7 per cent. of the cases presenting the hæmorrhagic form. At Aigle and Ivorne, where the number of cases were ten times more numerous than at Geneva, there were scarcely seven hæmorrhagic variolas in 1000 cases. In the Genevese epidemic one case in five of hæmorrhagic variola were cured, but in these the hæmorrhage consisted merely in epistaxis or metrorrhagia supervening during the course of the variola. There were very few cutaneous hæmorrhages among the cases cured. The hæmorrhagic form was observed to be twice more frequent among the unvaccinated than the vaccinated; but eliminating the slight cases, which belonged exclusively to the vaccinated, and comparing only the serious cases of the two categories, we then find more hæmorrhagic cases among the vaccinated. Comparing the deaths, there were 23 per cent. of the unvaccinated, and 65 per cent. of the vaccinated which presented the hæmorrhagic form; so that while it is only one of various causes of death among the unvaccinated, it is the chief, if not the only cause among the vaccinated. It was observed that hæmorrhage complicated a great number of cases of different diseases during the autumn of 1858, the period when the hæmorrhagic form of variola was at its maximum of frequency at Geneva. It was chiefly between the ages of 20 and 40 that this hæmorrhagic form was observed among the vaccinated. Death occurred about the sixth day (the third of the eruption) in one-half of the fatal cases.

The mean duration of the variola at Geneva was fourteen days in cases which recovered, and eleven and a-half days in those which succumbed. The mean duration of the prodromes was from three to four days, and that of the eruption, until the period of desiccation or suppuration, from three to seven days. In some cases there was observed a successive development of the eruption, so that certain of the papulæ appeared five or six days after the first, and died away without undergoing further development.—*Arc. Gén.*, tome xiv. pp. 78—82.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, December 12, 1859.

My attention has been directed to a letter, dated from Brighton, November 25, and signed "R. L.," which appeared in the *Times* newspaper, in which the writer, after remarking on the inefficiency of the present system of vaccination, as practised in England, makes special reference to the existence of an Institution in Paris, where children are vaccinated directly from the calf,—or rather the last of a series of eight calves,—a process of transmission from calf to calf being, according to him, indispensable, in order to diminish the original energy of the virus, which if taken directly from the cow, might prove too strong, and consequently dangerous, to the child or children on which it might be employed. The writer further states that this Institution furnishes matter to all and sundry, who may apply for it at the very moderate sum of five francs for each tube. Now, on reading this letter, any thinking, reasoning man, can see absurdity in every line of it; and I am entirely at a loss to know what may have been the motive of the person who penned it. Is the letter a *réclame*, or has the writer of it, in gross ignorance of the subject of vaccination, penned it in good faith, believing that he was doing a service to humanity? If the former, then we must regard him as an accomplice in a system of deceit and dupery. If the latter, I would strongly recommend him in future always to inform himself well on a subject of such vital importance, before publicly denouncing the Institutions of his own country, and lauding those of another. Although perfectly satisfied from the first that the whole affair was a hoax, yet, to make assurance doubly sure, I conceived it to be my duty to sift the thing to its very bottom. On all sides, and in every quarter where I thought it likely I might get information on the subject, I could not find any one who had heard of such an establishment, and in all the recognised registers containing the names of the regularly-qualified practitioners of the French capital, I searched in vain for that of its *soi-disant* director, Dr. Mangeant. But as the omission of the name of that individual might, I thought, be an accident, I repaired at once to his address, as given by the writer of the letter in the *Times*; and in an obscure house in the Faubourg St. Denis, up some three stairs, I found a person answering to such a name,—but neither cows nor calves were visible, and I could see no suitable *locale* in the neighbourhood of his dwelling where they could have the necessary accommodation. The walls of the entrance-passage, leading to the staircase, were covered with huge placards, and similar ones formed the principal ornaments of the ante-chamber. Here follows a literal translation of these placards:—"Natural Vaccination with the Virus taken always from the Heifer, according to the Principles of Regeneration. These Vaccinations are performed in the Faubourg St. Denis, and are practised by a Doctor, Member and Vaccinator of the ex-National Society of Vaccine of France, under the direction of the late Dr. James."

Now, had my visit taken place under the most perfect conviction that the Institution in question was a *bonâ fide* affair, I must confess that the above advertisement would have been of itself sufficient to have excited the gravest suspicions as to its object and character. Having sent in my card, I was speedily ushered into the presence of the said Dr. Mangeant, whom I find to be a respectable-looking old gentleman, some sixty years of age, grievously pitted with the very malady against which he pretends to furnish an infallible preservative. In his conversation he manifested no reserve, answering all my questions readily and promptly. He informed me that the Society formerly known as the "Société Nationale de Vaccine de France" no longer exists as such, it having been dissolved when its patron and protector, the late Louis Philippe, left the throne of France; and that he (Dr. Mangeant) is now the sole and entire representative of it,—its original founder and director, Dr. James, having died some five or six years ago; that he has a farm in the vicinity of Paris, where he maintains a constant succession of young cows, which furnish sufficient of the original virus, not only to vaccinate hosts of poor children, but also enables him to meet the numerous and pressing demands which pour in on

him from all sides, even from the most remote parts of the world. He placed before me a long list of names of individuals from whom he had received orders, and among other documents, actually put into my hand several letters which he had that very day received from sundry Medical men in England,—who had, no doubt, been led to apply to him in consequence of their having placed faith in the assertions contained in the letter which had appeared in the *Times*. To the objection founded on the difficulty encountered by Medical men and others in their search for the real cow-pox in cattle, he promptly replied that by great experience, and the use of certain instruments, he could always succeed in finding the disease among cattle, when to the ordinary observer it would pass unnoticed. On being reminded that an enormous number of calves must be requisite to meet such frequent and extensive demands, he replied that it was not necessary that the virus should be transmitted through eight calves in succession, as mentioned in the letter in the *Times*. His system is, he says, to search for the genuine pox on the cow, and when found to vaccinate a calf, which latter furnishes matter fit for use on the child; and that notice being given him three or four days in advance, he has a young cow or calf brought to his house when the child can be vaccinated on the spot.

Having heard all he had to say on the subject, and feeling more convinced than ever that the whole affair was a farce, I directed my steps to the "Académie de Médecine," and at the 'Secretariat, received the following details, which I give for the benefit of your readers:—Some five-and-twenty years ago a certain Dr. James was in practice in a provincial town of France. He was a shrewd, active man, wanting neither in talent nor energy, and while honourably engaged in the exercise of his profession had particularly turned his attention to the question of vaccination, which was at that time much agitated. He several times addressed communications on the subject to the Academy, so highly interesting and meritorious that on three different occasions medals of encouragement were conferred on him by that learned body, and in addition to these honours he was made one of its corresponding members. Not content, however, with the comparatively obscure position inseparable from a provincial practitioner, he came to Paris, where he duly announced himself to the public as a Member of the Academy, selecting as his *specialité* the subject of vaccination. This he agitated with so much tact and address, that he enlisted in his favour the sympathies and patronage of some of the higher classes of society, and among others he succeeded through the Queen Marie Amalie, in placing on the list of his subscribers the name of Louis Philippe himself. Backed by such powerful patronage, it was only natural that he should succeed; and he forthwith founded and organised an establishment, to which he gave the high-sounding name of "Société Nationale de Vaccine de France," the end and object of which was to secure to the public the rare benefit of vaccination founded on the principles discovered and acted on by the immortal Jenner; in other words, vaccination with the virus taken directly from the cow. For a time the Society seemed to flourish, no one suspecting either deceit or dishonesty on the part of its founder. All believed that it was a purely philanthropic affair, and to have suspected such a man without good cause, would have been cruel indeed. After a short time, however, Dr. James began to show the cloven foot, and certain dirty actions of which he was guilty revealed what the man really was, and that speculation was at the bottom of the whole transaction. An inquiry was set on foot which so perfectly convinced his distinguished patrons of the trickery which was being practised, that they immediately withdrew their countenance and support, and the Academy of Medicine having been informed of the result of these investigations, effaced his name from the list of their members. Like most charlatans, Dr. James was tenacious of the honours which had been conferred upon him at the time when he was regarded as an honest man; and he resolved not to be unfrocked without a struggle. Thus, in spite of the formal intimation he had received of his name having been expunged from the list of the Academy, he had the effrontery to take his seat within its sacred *enceinte* at the very next meeting of that body. The President, on seeing him, rose and moved that he should immediately quit the *salle*, or at least the benches consecrated to the recognised members of the Academy. This motion was carried unanimously, and Dr. James, who actually per-

sisted in remaining, *malgré* this public order, was removed by *vive force* by the *huissier* of the Academy. Expelled thus from the ranks of scientific and honourable men, he continued to traffic and speculate on the credulity of the public, taking every opportunity of getting himself named in foreign newspapers, and using all means in his power to make as much out of the thing as he could, until about six years ago, when he died of cancer of the tongue. Such is a brief history of the founder and director of the ex-National Society of Vaccine of France. He was succeeded by M. Mangeant, of whom nothing can be said, except that his name is not to be found on any Medical List or record in the Empire. Now, I trust, sufficient has been said to convince the readers of the *Medical Times and Gazette* that France is not so much ahead of us as the writer of the letter in the *Times* newspaper would fain make us believe. How or why should she be? Are not our countrymen equally intelligent and equally persevering in their researches as are their Gallic brethren? The true cow-pox, so rarely to be met with in cattle in England, is equally rare here; and it is now two entire years since a true case has been known in all France, although agents instructed to search for it are appointed by the Academy, in each of the eighty-six departments of the Empire. The last case was found in a cow at the cattle-market of Poissy, and from it the Academy renewed their vaccine lymph. In the last report made by the Central Committee of Vaccination to the Government, the Academy shows that it does not believe in the actual degeneration of the vaccine lymph, although it renews it on every possible occasion, in order to satisfy the scruples of such members of the Profession as may hold a different opinion. In the absence of the spontaneous malady, and owing to the consequent difficulty of renewing the virus from its original source, science has endeavoured to supply this desideratum by inoculating the cow with the lymph taken from a child's arm, in the hope that the animal which originally supplied the virus might restore to it its primitive energy. This method is every spring had recourse to by M. Alfred Vy, of Elbauf, one of the Corresponding Vaccinators of the Academy of Medicine. Experiments of a like kind have been made by the author of "the Report to the French Government," who states that he has inoculated twenty young cows, and that in nearly every case he was successful. From the pustules thus produced on these animals he collected the virus, and with it vaccinated several children; but he found the pustules thus produced on the children's arms in all respects identical with those which were produced by the same lymph before its transmission through the cows, and he boldly declares that no good whatever is to be obtained from this pretended method of renewing vaccine lymph. Thus, taking for granted that the ex-National Society, to which we have alluded, procures its lymph from the heifer, by the process above noticed, as practised by M. Vy (which may or may not be the case), still, the lymph so obtained is in no respects better than that obtained in the ordinary way. But it must also be borne in mind that the Imperial Academy of Medicine furnishes lymph *gratuitously* to all who think proper to apply for it,—and what guarantee have those who address themselves to the Faubourg St. Denis that the lymph forwarded to them at five francs a tube is not derived from this very source? Several members of the Academy to whom I have spoken on the subject think this not at all improbable.

The question most agitated by the Academy at the present time is rather the manner in which vaccination should be performed successfully, than the quality of the lymph used. Of its preservative virtue against small-pox they have no doubt, provided always the operation be faithfully and well performed; and they are convinced that in a large majority of those cases in which genuine variolous attacks have been observed among those reported as having been vaccinated, these conditions have not been rigidly fulfilled. How can they be? seeing that this important operation is frequently entrusted to the ignorant and uneducated, such as midwives, sick-nurses, and *employés* at Mairies. It is just possible that in five cases out of ten a false pustule is, by that class of vaccinators, mistaken for a genuine one; and if in any of these five cases a virulent attack of small-pox occur, the hue and cry is raised that the vaccine lymph has degenerated, and that vaccination is no longer what it originally was—a preservative against that disease. To vaccinate with success, says Wirer de Rettenbach, of Vienna (a great authority on this subject), it is necessary that the matter be taken from a child in good

health, and that it be transmitted to one equally so, and that the age of the children should be as nearly the same as possible. Experience has shown this distinguished writer that the transmission should be made from the older to the younger subject; he having on many occasions vaccinated without success an infant for whom the lymph had been taken from children younger than itself, whereas, vaccinating the same child, shortly afterwards, with lymph taken from the arm of an older child than itself, he obtained complete success.

May not these remarks tend to explain the difficulty so frequently observed in obtaining a proper result in the re-vaccination of adults with the lymph taken from the arms of very young children? While on the subject of re-vaccination, which the majority of Medical men now consider necessary, I may remark that there is a difference of opinion among the celebrities of the French capital, touching the period of life at which it should be practised. M. Serres, for example, prefers the fourteenth year, while M. Bousquet thinks it should be practised at the age of ten or twelve, and I have often heard M. Troussseau state it as his conviction that it should be had recourse to every five years, if possible, and that in no case should more than seven or eight years elapse between the operations.

GERMANY.

MUNICH, December 5, 1859.

I think the readers of the *Medical Times and Gazette* will be interested by a short account of a book just brought out by one of the ablest German Physiologists, and which, as its style is rather abstruse, might easily be overlooked. It is entitled "Die Gesetze der Ernährung des Fleischfressers," and is by Professor Bischoff and Dr. C. Voit.

In this work the laws of nutrition of carnivorous animals have been brought, by innumerable experiments, to a point of mathematical accuracy, and there can be very little doubt that the results of these investigations are, to a great extent, directly applicable to human physiology.

In the first place the authors ascertained that in a dog, kept for two years under observation by them, all the nitrogen of the food assimilated was excreted as urea. Then they found out that urea is never the product of a simple oxydation of the albumen of the blood, but always only a product of the retrograde metamorphosis of the azotised tissues. They defined the law, that the process of disintegration and metamorphosis of the azotised tissues is not produced by the simple affinity of the oxygen alone to the disintegrating tissues, but by the double attraction of the nutritive matters of the food, and of the oxygen to these tissues. Just as chlorine alone or organic matter alone cannot decompose water, notwithstanding the strong affinity the former possesses for the hydrogen, and the latter for the oxygen of this fluid, decomposition of the water at once takes place if an organic substance and chlorine combine their action. The extent of the process of the metamorphosis of azotised tissues depends, firstly, on the amount of food taken; secondly, on the quantity of oxygen present; and, thirdly, on the bulk of the organs undergoing disintegration. These three agents, reciprocally balanced together, act constantly on the process of disintegration, which is, in fact, to be looked upon as their function. In regard to different kinds of food, Professor Bischoff and Dr. Voit ascertained that the animal always uses up first the azotised parts of the food taken. An increase of these parts always produces an increase of the metamorphosis of tissues, and if they are given in sufficient quantity the dog is, by them alone, enabled to keep up its expenditure for the necessary motory and calorific power. But although a dog can be kept on meat alone in entire possession of all its functions, one part, viz. the calorification, can be kept up more economically by fat. In this way a right proportionment of fat with the food prevents a waste of azotised nutriment. But an addition of fat to a quantity of azotised nutriment, in itself sufficient to keep up the motory and calorific powers, causes an increased disintegration of the azotised tissues of the body, because more power is now required for the digestion, circulation, and oxydation of the nutritive fluids. Within certain limits, but not beyond them, meat and fat

can compensate each other. If one wishes to make an animal gain flesh, one must always give it fat with its meat, because it will then soon be enabled to appropriate part of the azotised matters of the food, for the new formation of flesh. If one wants to fatten an animal, one must give it, besides fat, as much meat as is required for the due maintenance of its azotised tissues; the animal will, otherwise, lose flesh and die. Starch and sugar act similarly to fat, but rather more strongly; for, taking the amount of hydrocarbon as a standard, two and a-half times less sugar than fat will compensate for an equal quantity of nitrogenous substances. The reason of this is probably that the sugar is at once burnt in the blood, while the fat seems to have first to undergo a further metamorphosis. Rye-bread alone (containing 2.39 per cent. of nitrogen in its dried state), was not found to be a sufficient nutriment for a carnivorous animal; at least, as long as the animal was in a condition of strength, it excreted constantly more nitrogen than it took in with the bread (which was offered in unlimited quantity). In a weakened state, however, — that is, with a smaller proportion of azotised tissues requiring to be nourished, — the nitrogen of the bread might, perhaps, suffice for the necessary expenditure. The same is probably the case with human beings. In regard to gelatine, that is to say what is sold in Germany under the name of "French gelatine," the experiments have given results contrary to the opinion now generally held by physiologists, that gelatine has no nourishing qualities, it being proved that gelatine is still able to replace the albumen in the food to a certain extent. But four times as much gelatine as albumen would be required to obtain the same result, which bulk the animal cannot take in. Although animals fed exclusively on gelatine would, therefore, ultimately die of cold and starvation, not being able to take in sufficient quantities to make up for the expenditure in motory and calorific power, still it must be maintained that the gelatinous tissues are at least, to a certain extent, able to create power.

As the authors have found the numerical proportions on which all these various results depend, it is clear that in future the question as to the most suitable nourishment of an animal, as well as of a human being, can be made out in the most exact way. This treatise, therefore, is worthy of the careful attention of the Physiologist as well as of the scientific Practitioner.

FOREIGN LUNATIC ASYLUMS.—There were treated at the Maréville Asylum, in the female department alone, 708 patients. There were 32 cures, and 53 deaths. The Asylum at Stéphanfeld was founded in 1835, and from then to 1858 there have been 1584 patients treated within its walls, viz.: 814 males, and 770 females. The cures have amounted to 34 per cent., or rather above a third. An English retired Surgeon, lately settled at Lyons, is about to construct a house at Lyons, to be called "The Temperance," in which he pledges himself, under forfeit, to cure drunkards. Why not try his hand at Glasgow first? Holland contains 19 lunatic asylums, of which only 2 are private. Prussia has 56 establishments for the insane, 28 public and 28 private. Austria has only 18 special establishments. In Switzerland there are 36 establishments, including those for cretins and idiots. The heirs of Colonel Kunz, of Zurich, known under the name of the "King of Cotton-spinners," have devoted 400,000 francs for the construction of a new asylum.

At the meeting of the Academy of Medicine of Paris, on the 29th November last, the President announced to the members (according to the *Gaz. des Hôpitaux*): "That M. Markett, Surgeon of the Hospital St. George, of London, assisted at the meeting; and Monsieur the Perpetual Secretary presented in his name a volume entitled 'Medical Diagnosis.'" We suppose the M. Markett must be Dr. Barclay, who we need hardly say, is not Surgeon to St. George's Hospital.

PUBLISHED Cases of Ligature of the Carotid Artery in diffuse intra-orbital aneurisms.—Travers, 1804, successful; Dalrymple, 1812, successful; Roux, 1829, partially successful; Scott, 1834 (?), successful; Busk, 1835, successful; Jobert, 1839, successful; Velpeau, 1839, partially successful; Herpin, 1844, successful; Pèrequin, 1845, fatal; Curling, 1852 (?), successful; Brainard, 1852, unsuccessful. Statistics, therefore, are in favour of this operation.—*Gaz. Heb.*

GENERAL CORRESPONDENCE.

ON MEDIAN LITHOTOMY.

LETTER FROM MR. BOWMAN.

[To the Editor of the Medical Times and Gazette.]

SIR,—Mr. Teale, in his admirable paper on Lithotomy in your last week's number, alludes to a dilator which Mr. Weiss has been making for me, and I may, therefore, briefly describe it, though I should otherwise perhaps have delayed doing so till it had been fully tried on the living subject.

It consists simply of two blades, either united together at one extremity, or fitting one into the other there, and terminating in a slightly-curved probe-point, adapted to enter the bladder readily from the perineal wound along the groove of the staff. The blades being of thin steel, form a sufficiently rigid stem when closed, and admit of separation with flexion by the finger run in between them; thus, of course, dilating the prostatic canal transversely without any forcing forwards of the neck of the bladder. The principle involved is the same as that of Mr. Holt's excellent stricture-dilator, which probably gave me the idea. The blades are of such a length as to extend from the external wound a little way within the prostate, and the probed extremity reaches from half an inch to an inch beyond. The blades, in diverging from the point of union, become gradually broader, and are a little hollowed on their opposed surfaces, so as to fit the finger. At their free ends they are curved outwards at an angle, and one of them is extended into a handle, which is to be firmly held by the right hand, while the left forefinger is being introduced as a dilator between the blades.

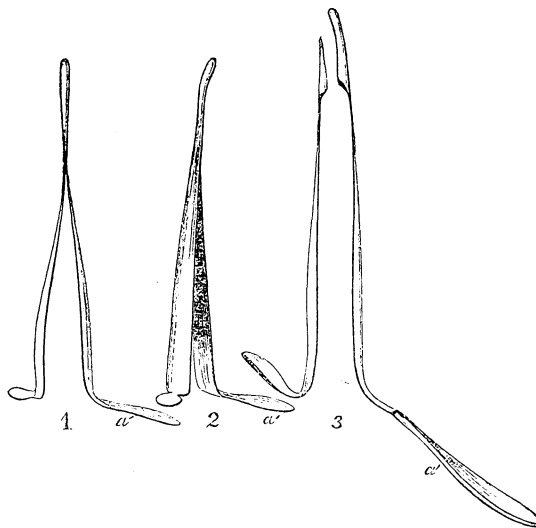

It is well known to lithotomists that in young children there is some risk of thrusting the neck of the bladder before the finger, as the latter seeks to enter its cavity, after the deep incision, and that operators deficient in coolness or dexterity have on rare occasions failed in consequence to enter the bladder at all, or have done serious, and even fatal, damage to its attachments. In such a difficulty the dilator now devised might be of use. What is customary in such a case is to introduce the knife afresh along the staff and extend the incision in the prostatic region—a proceeding of some hazard in these young subjects, and probably much less safe than to dilate.

Recent opinions have more and more concurred in prescribing, with Brodie and Liston, a very limited incision of the prostate, and an extension of the opening by means of the finger, the blunt-gorget, or the blades of the forceps in withdrawing the stone. It is admitted on all hands that the prostatic canal is highly dilatable, or at least that it may be split open with little danger when partially divided by the knife; and the safety of the modern lateral operation is acknowledged to depend mainly on the limited extent of the deep incision. Where a cutting instrument is run along the staff into the prostatic canal, it is in the nature of things that in the best hands it may sometimes wound more deeply than is intended, either by falling too much away from the groove of the staff, or by going too far into the bladder, and by having an inclination a little different from the intended one. Hence, occasionally, cellular infiltrations or hæmorrhages, adding heavily to the anxieties of the Surgeon in the after treatment, and perhaps proving fatal.

I cannot but think that the median operation, aiming as it does only at an incision in the middle line, where no damage can be done, and carried only up to—not into—the prostate, must be highly worthy of adoption, unless experience should prove that it is attended by insuperable dangers more than counteracting its obvious advantages, and greater than those of the lateral operation. Dangers there undoubtedly are, as experience has proved, in attempts to dilate the neck of the bladder. I believe the dangers of slow dilatation are necessarily very great, modifying, as that process must do, the circulation of this important region, inducing inflammation in the neighbouring tissues, infiltrations, or venous contaminations. There may be dangers also in rapid dilatation as proposed by Mr. Allarton; but I confess it appears to me that the efforts of Surgeons should be now directed to test these dangers, to avert them, as it seems quite possible to do, and thus

to secure the removal of the stone with the least risk to life. There is no subject in surgery which requires to be considered from so many independent points of view as that of stone, for one case differs from another in the most important and essential particulars. A deep perinæum, a large prostate, a bulky stone, no less than the varieties of age, are conditions materially altering the whole character of the operation; and I am inclined to think that further study of the method of dilatation following an incision of the urethra in the median line up to the prostate, will cause that mode of operating to gain ground in the estimation of Surgeons.

To revert to the median operation of Mr. Allarton in young children, I lately found the same difficulty which Mr. Teale speaks of in carrying the finger along the staff or probe into the bladder after the incision of the membranous part of the urethra. In those subjects the prostate can hardly be felt by the finger in the rectum, and as the finger so placed runs nearly parallel to the membranous part of the urethra and neck of the bladder, it must be a little uncertain at what exact point the knife thrust in between the urethra and rectum enters the former channel. If it does not enter quite close to the prostate in cutting forward, so as to divide the lower wall of the urethra, it must leave a little of the membranous part of the canal undivided, as well as an important part of the deep fascia, and it becomes desirable, as Mr. Teale suggests, to carry the knife a little backwards up to the prostate in such cases. At least if this be not done, it will be found very difficult to insinuate the finger along the staff or probe, whether along its upper aspect or its side, so as to enter the bladder; for the end of even a small finger is too large and blunt an instrument to easily find the orifice of so small a canal as this is in young children. In these subjects also the ligaments and fasciæ holding the neck of the bladder in place are so slender as to yield and tear much more readily than in the youth or adult. Hence the idea of the dilator now described.

FIGS. 1 and 2.—Two views of the Dilator with united blades.

FIG. 3.—Form of a Dilator on larger scale with moveable blades.

aaa. Handles to be held by the right hand, while the left forefinger moves up between the blades.

(The figures are on a reduced scale.)

There are two forms of it for trial. In the first, the blades are joined, and after the dilatation is complete, the finger would have to be withdrawn in order to disengage the instrument, though the bladder might probably be first explored by it, to ascertain the position and size of the stone. In the second form, one blade is received into the other near the probed extremity, and the blades thus admit of being withdrawn in succession by the right hand, while the left forefinger is still in the bladder.

The whole length of the dilator for the youngest children is three and a-half inches; a larger scale might be adopted for young subjects of somewhat greater age.

With regard to dilators for the median operation in adults, I have proposed to Mr. Weiss to make one on the same principle as the foregoing, but of such a size as to be opened, not by

the finger, but by an ovoid plug, to be run in between the blades, of such a size as might be required in various cases according to the size of the stone. Without at all intending to prejudge the question, I think it worth trying whether an instrument on this principle would not offer some advantages over the three-bladed dilator as modified by Mr. Teale.

I am, &c. WM. BOWMAN.

Clifford-street, December 12, 1859.

ON THE REMOVAL OF STONE BY DILATATION OF THE NECK OF THE BLADDER.

LETTER FROM DR. ARNOTT.

[To the Editor of the Medical Times and Gazette.]

SIR,—The very interesting paper of Mr. Teale on the Removal of Stone by Dilatation, which appeared in your last number, is a valuable addition to the statistical records lately published in the *Medical Times and Gazette*. I believe that it is to the fact, first learned from this Journal, that, now-a-days, "the cures from lithotomy in the adult are balanced by the deaths," we must chiefly attribute the rapidly-growing reputation of the operation of dilatation for stone, in lieu of that of cutting; and it is curious to observe that the principal objection which the late Mr. Keate made to it (See *Medical Gazette*, Dec. 18, 1830), and which put a stop to his investigations on the subject, was the supposed safety of lithotomy rendering any improvement unnecessary!

We owe very much, likewise, to Mr. Allarton's zeal and ability in advocating this plan of treatment, and to the publication of his own success with it. In speaking of the proceeding recommended by this gentleman, as a renewal and improvement of Marianus' median operation, Mr. Teale hardly does it justice. They can scarcely be said to be founded on the same principle. The Surgeons who, a hundred and fifty years ago, employed the "apparatus major," must have known that they more frequently ruptured, or tore the neck of the bladder, than distended it; whereas, in the recent use of dilating instruments, the great success from this measure in many parts of England and the United States, would show that the contrary has been the usual result,—that tearing has been the exception, and not, as in the other case, the rule.

On this account, I think, the application of the term "median operation" to that recently employed, is somewhat objectionable, as it confounds it with the ancient proceeding. The precise line of incision is, no doubt, an important matter; but it is of much more importance to determine whether tearing or dilatation is produced by the measures employed; and, therefore, if any other term than dilatation be applied, that of Lithectasy, which was introduced by Dr. Willis, would appear preferable to the former names.

It is not, however, only by the name that Mr. Teale would assimilate it to the old operation, but, also, in a very considerable degree, by the mode of procedure. He appears to think that, in almost every case, a dilator, consisting of several diverging steel rods, should be used, and should supersede the breaking of the stone when this is of great size.

The objection to this practice is, I think, forcibly illustrated by the fatal case related near the end of the paper, in which three wounds or bruises were observed on the prostate, made by the pressure of the three rods of the dilator. A dilator that presses unequally on the orifice or canal which it enlarges must, if the resistance be considerable, wound or bruise the particular parts pressed upon, and consequently seriously increase the danger of the operation. The dilator which was used by Sir Astley Cooper in the first operation of this kind performed in modern times (and which is still in my possession), was a membranous tube distended by a fluid, and was, consequently, perfectly equal in its action. Such a dilator has other advantages in its being more easily introduced, and in its exerting, when fully expanded, the same distending force throughout the whole length of the instrument.

In a recent number of the *Medical Times and Gazette* (July 24, 1858), Mr. Spencer Wells relates the removing of a stone from the female bladder by a dilator of fluid pressure, fabricated in a very perfect manner, under his directions, by Mr. Coxeter. For opening the prostatic urethra one of greater strength is required; but this is easily effected by furnishing the distensible tube with a silk tunic, which not only strengthens it, but gives it fixed or definite dimensions.

Mr. Wells has informed me of several trials he has made with the fluid dilator on the adult male prostate in the dead-house. He found the prostate less easily dilated than he expected, and I believe less easily than the *living* prostate would be.

The administration of chloroform enables the Surgeon to dilate the prostate rapidly by such an instrument without causing pain; and as the quantity need not exceed that usually given to prevent suffering from the dilatations attending childbirth, there can be little objection to its use. But whether, as respects the result of the operation, the dilatation should be quick or slow, remains to be ascertained. The rapidity of the process must depend very much on the dilatability of the part, the extent to which it is carried, and the general condition of the patient. The extraordinary success of the Italian Surgeon, De Borsia, shows that rapidity of dilatation can be effected with greater safety than could have been supposed. Many, however, would object to the use of chloroform in this operation for the same reason that they object to it in lithotomy. An objection which has been made, especially in the cases of children, to using the forefinger as the dilator in this process, is, that there is danger of breaking the urethra and pushing it before the finger instead of entering the bladder. A fluid dilator of eccentric action is without this defect.

It has been said that there has been much unnecessary controversy about the form or kind of knife that should be used in lithotomy, and that any knife will answer if properly used. This is not improbable; but the same cannot be said of the various dilators. Between these there is so great a difference as will often make death or recovery depend upon the choice. My conviction (founded upon much experience in the use of fluid pressure dilators for various surgical purposes) that the more extensive dilatations of the neck of the bladder can only be safely thus produced, and that in every case there will be advantage by thus avoiding the irritation which is caused by the friction of wedge-acting dilators, and the unequal pressure of steel rods, will, I trust, be deemed a sufficient apology for this communication.

I am, &c. JAMES ARNOTT.

ON FŒTAL AUSCULTATION.

LETTER FROM DR. FRANCIS ADAMS.

[To the Editor of the Medical Times and Gazette.]

"Men are fond of certain tenets upon no other evidence but respect and custom, and think they must maintain them, or all is gone, though they have never examined the ground they stand on, nor have ever made them out to themselves, nor can make them out to others. We should contend earnestly for the truth."—Locke on the Conduct of the Understanding.

SIR,—From the statements which have been made under the present head in this Journal, it would appear, contrary to my expectation, that there is such a discrepancy in the views of the stethoscopists regarding the sounds detected by auscultation of the heart and of the uterus, that I consider it necessary to determine, if possible with precision, what may be assumed as the generally admitted facts of the case, before attempting to settle those points about which a considerable difference of opinion prevails, and which I am anxious to establish.

The following, then, would appear to be acknowledged and regarded by all the authorities, from Laennec downwards, as the ratio which subsists between the pulse and the sounds of the heart, both in adults, and in new-born children.

Every arterial pulse at the wrist has synchronous with it an impulse in the cardiac region, and every impulse is accompanied by two sounds, first, by a loud, and more prolonged sound, and, secondly, by a feeble, and more abrupt sound. Pulse and impulse are recognised by the touch; the sounds by the sense of hearing. Many people, indeed, find some difficulty in detecting the second sound, even in the adult state, but these are dismissed with a scornful notice by such distinguished stethoscopists as the late writer on Fœtal Auscultation in this Journal. We may assume it then as being generally conceded that in the adult state the pulse and impulse range from about 70 to 80, and the cardiac sounds from 70 to 80 double sounds, or from 140 to 160 single sounds. At birth the highest authorities agree that the pulse is about 140, and consequently the cardiac sounds must be about 280; that is to say, 140 strong, and 140 feeble sounds. These are

generally denominated the "tic-tac" sounds by the authorities—the "tic" meaning the strong, and the "tac" the feeble sounds. In utero no one pretends that generally either the one or the other is less frequent than at birth; and consequently we may venture to assume as admitted that at this period the "tic-tac" sounds, taken together, should range from 260 to 280 per minute (a). Whenever, then, an auscultator in the abdominal regions detects regularly such a low number of single sounds as 160, there can be no question that these are to be referred not to the foetal, but to the maternal heart; at all events most certainly not to the former. Whether, indeed, the fact be absolutely and unquestionably, as stated by the celebrated auscultator in the far North, we shall not pretend to affirm or deny, but this point settled, and the inference is irresistible that these 160 single sounds cannot have proceeded from the foetal heart. No, no, this is the standard of the adult, and not of the foetal heart. And, by the way, it may be that this is the true explanation of the mistake committed by the learned auscultator in the case of spurious pregnancy, related by Dr. Simpson, who may have fallen into the same mistake as our Northern Auscultator in confounding the average standard of the adult with that of the foetal heart. We think, then, the question is, in so far, set at rest, that granted 160 single sounds can be regularly detected in auscultation of the pelvic region, no one has any right to infer therefrom the existence of a living foetal heart in that quarter.

But, it will here be asked, What if about 140 double, or "tic-tac" sounds can be detected per minute in the pelvic region, is not this an absolute and unmistakeable mark that a living foetal heart must exist within? Dr. R. Fergusson, in his Preparatory Essay to Dr. Gouch's work "On the most Important Diseases of Women," lately published by the New Sydenham Society, answers this question in the negative. In the first place "it is often not found," and even when discovered, it is no certain mark of pregnancy, as the following case proves beyond controversy:—A poor girl was violated: her belly enlarged; and she was supposed to be pregnant, and, no wonder, seeing the "tic-tac" sound could be heard 140 times in a minute." Yet it turned out to be a serious collection, as was ascertained by tapping with a trocar. It appears, therefore, that whether the allotted number of sounds be regarded as single or double, in neither case are they any certain mark of pregnancy.

We must now say a few words respecting what is usually called the *placental soufflet*; and here again we must come to an understanding regarding the general facts involved in this question.

Bellows sounds, or *bruits de soufflet* (sounds which have not inaptly been compared to those of a locomotive just about to start on a journey), are generally admitted to be produced more especially by the pressure of the stethoscope on enlarged vessels, whether arterial or venous, but also not unfrequently, as I myself can attest, by muscular contraction, and the passage of air through an internal tube, such as the trachea in the neck, or the intestinal canal in the abdomen. Altogether these soufflets are admitted to be very fallacious guides in diagnosis, for what Physician is there of experience who has not known very many cases in which vascular tumours have been thus diagnosed as aneurisms, and *vice versa*? Few can have had many opportunities of seeing abdominal tumours, and not met with cases in which they were accompanied with strong *bruits de soufflet* (see *Cyclopædia of Medicine*, vol. iii. pp. 484, 485). Dr. Meigs thus expresses the result of his experience in this matter:—"As to the value of the *bruit de soufflet* in the diagnosis of pregnancy, it has been found that the earlier opinions were erroneous; and I believe there are few well-informed Physicians to be now met with

who give it even the smallest portion of their confidence in the unfacile discriminations that they are sometimes charged to make. It is not to be doubted that the sound is produced by the rush of blood in vessels, and, in my opinion, sustained by a very long practice in obstetric auscultation, it depends upon the motion of the blood in the iliacs and hypogastrics. I have certainly heard the same sound after delivery as before the child was born, and I have heard it as dependent upon pressure by tumours within the abdomen. Hence I have not the least confidence in it as an object in obstetric auscultation."—"Obstetrics," p. 240. Dr. Fergusson, in the work quoted above, expresses himself to the same effect in the strongest terms. He has known it produced by pelvic tumours in cases of putrid fœtuses, and morbid placenta; hence he holds that "it affords no diagnostic mark as to foetal or placental development."

After all this, what can we think of the Northern Auscultator who, on the contrary, affirms that "scarcely any one at the present day entertains a doubt that in almost every case of pregnancy after the seventh month, both the pulsations of the foetal heart and the *placental soufflet*, can, with a moderate degree of care, be readily distinguished," and "that there is no possibility of a mistake being committed here?" For that "the sound of the foetal heart can by no stretch of imagination, no flight of fancy, no exercise of faith, no intensity of impression, be confounded with any other. It is a sound *per se*."

I am confident the writer of these sentences stands alone at the present day, in holding the strong opinions here announced; and I shall only beg leave to add that I trust he does not reduce them to practice himself, nor encourages the youth of the Profession to do so. For most assuredly if the young Practitioners of the obstetric art regard it as a rule that whenever in attending cases of protracted labour they cannot with moderate care detect a soufflet and 160 sounds in the pelvic regions they are quite warranted in dealing with the child as a dead body, and in applying the peforator to its head; they will soon become familiar with sights which will fill their hearts with sorrow and cover their faces with shame; sights which I forbear to describe,—although I have both heard and read of such cases; but I feel grateful to Providence that albeit I am denounced as the holder of heterodox doctrines in obstetrical stethoscopy, I never was condemned to witness any such in my own practice.

With regard, then, to foetal auscultation, I think the following points have been satisfactorily determined:—

1. That the cases of spurious pregnancy related by Dr. Simpson, in which eminent auscultators fancied they could detect the double sounds of a foetal heart when there was none present, and the various other instances of a similar character related above, all go to prove that this process of diagnosis is not at all to be relied upon as a test of pregnancy.

2. That the leading facts of the case are so differently stated by different individuals as to put it beyond doubt that these statements must have been much modified by previous impressions and modes of faith.

3. That since soufflets are often heard in the case of pelvic tumours, after delivery, and when the fœtus is putrid and the placenta morbid, they cannot be regarded as placental nor as indicative of pregnancy at all.

4. That the sounds detected in the uterine region, unless double, cannot have been cardiac, nor unless double the arterial pulse of the fœtus, can they have been connected with its heart, consequently that such an amount as from 140 to 160 single sounds cannot be referred to the foetal heart.

5. That one of the authorities for foetal auscultation admits candidly that even this number of 140 double, or tic-tac, sounds is often not present in pregnancy; and, on the other hand, that it is sometimes present when there is no fœtus in utero.
6. That the foetal heart is so surrounded by a large mass of dense maternal structures and blood-vessels, and by the solid limbs and organs of the child, that it seems next to incredible that any sound emitted by it could ever reach the ear of an auscultator.

7. That the whole system of foetal auscultation originated soon after the dawn of general auscultation, when men's minds were excited by the love of novelty, and warped by many erroneous impressions and mistaken modes of thinking, and has since been mainly upheld by authority.

I am, &c. FRANCIS ADAMS, M.D.

Banchory, Nov. 14.

(a) The writer referred to above (*Medical Times and Gazette*, November 5), makes the singular averment, that "Dr. Adams is the first who affirmed that from 120 to 160 double beats could be distinguished." Now this I do not affirm, but I do say that the authorities, from the first writer on it perhaps in this country (see *Cyclop.* of Med. p. 242), down to the latest authority, Dr. Fergusson, all speak of the foetal sounds being double, and of excessive frequency; and the latter mentions "the tic-tac sound repeated 140 times per minute." Surely 140 brace of grouse mean 280 birds all the world over! When this writer talks of 60 to 80 maternal pulsations in the minute, surely he who contends so strongly for the distinctness of the second sound of the heart, does not mean to say that this is the amount of the adult sounds. He does not mean surely that there are 30 loud and 30 feeble sounds, but 60 loud and 60 feeble ones. Altogether, however, he evidently confounds beats with sounds. But sounds are double the number of beats.

ON THE EXISTENCE OF A FIBRINOUS CLOT IN THE HEART IN SOME CASES OF CROUP.

LETTER FROM MR. HENRY SMITH.

[To the Editor of the Medical Times and Gazette.]

SIR,—Some of your readers will perhaps recollect that a controversy took place, some two or three years ago, between Dr. Richardson and myself, on a question connected with the pathological appearances which were found in certain cases of croup in which tracheotomy had been performed. Dr. Richardson asserted that in some of these cases attended with peculiar symptoms, the cause of death was to be found in the existence of a fibrinous clot in the heart which was formed several hours prior to dissolution. He also stated that there was a wide divergence between the morbid signs in those cases where death was being brought about by obstruction to the breathing alone, and in those where the fatal event was ensuing from the presence of a clot in the heart.

Although at that time I had had a large experience in cases of tracheotomy for croup,—and I am sorry to say a very fatal experience,—I was by no means convinced that Dr. Richardson was correct in his views, although his statements and reasoning made a deep impression upon my mind.

At the meeting of the London Medical Society on Monday evening, Mr. Price brought forward a case where he had performed the operation for croup, and where the patient died. Dr. Richardson put the question to Mr. Price as to whether the heart had been examined after death, and then reiterated his views regarding the presence of fibrinous coagulum. In doing so, he referred to the difference of opinion which had existed between him and myself on this interesting question, and requested me to give to the Society the results of my observation since the period alluded to.

The President of the Society did not think fit to allow me to address any remarks respecting this question; and, therefore, I wish to state in your columns what I should have been glad to have stated to the Society, that further inquiry on this matter, and observation both on the living and the dead, have convinced me that Dr. Richardson's views deserve serious attention. As on the former occasion I considered them incorrect, and opposed them as well as I was able; so now, from a sense of justice towards that gentleman, I am glad to state my present conviction, that there are certain cases of croup in which the symptoms are more referable to an embarrassed state of the heart than to a mere obstruction in the windpipe. These symptoms consist of great dyspnoea, pallid face and lips, cold extremities, and very feeble pulse; whereas, turgescence and lividity of the face, with blueness of the lips, accompanied with extreme dyspnoea, mark the insuperable obstruction in the trachea. In the former cases I am now disposed to agree with Dr. Richardson, that tracheotomy will not save life, as there is very probability that a coagulum has formed in the heart, whilst in the latter experience teaches that an artificial opening in the windpipe may save life.

It is not the mere reflection on Dr. Richardson's views that has brought about an alteration in my mind respecting this point; but a careful examination, both on the living and the dead, has led me to believe that that gentleman is in a measure, at least, correct; and in order to be brief, I will just mention the details of one of the last cases of croup, where I was able to make a post-mortem examination:—

I was called to a child, aged 6, who was suffering severely from croup, and had been ill three days. The breathing was most laborious, the child making violent efforts to get air, and not moving the chest at all; the face was, however, very pale, and the lips were not blue. The pulse was extremely rapid and small. My opinion was sought regarding tracheotomy; I did not think it a favourable case. The operation was not done; and the child died in an hour.

I opened the body with the express view of ascertaining whether there was a clot in the heart; for the child presented just those symptoms expressed by Dr. Richardson. Surely enough, on opening the heart, there was seen extending between the right auricle and ventricle a firm deposit, and there was another fibrinous clot at the commencement of the aorta. The lungs were healthy, but the larynx was lined with a thick deposit, which very much narrowed the cavity; a thinner membrane lined the trachea. Now, it struck me at

once, that had tracheotomy been performed in this case, the existence of the coagulum in the heart would have prevented recovery had the obstruction in the windpipe been overcome; and I am now of opinion that some of the cases previously operated upon by myself, and presenting just the same symptoms as existed here, were instances where a fibrinous clot would have been found in the heart had it been looked for.

In another instance, where I was recently called to perform tracheotomy, the symptoms had come on within only a few hours. The child, aged 5, was lying in bed perfectly insensible, breathing with extreme labour; notwithstanding this, the pulse was pretty good, and the extremities not cold. I refused to perform the operation, and the child died in an hour and a-half. On examination there was not any coagulum in the heart whatever; but the lungs were excessively congested, and the upper part of the larynx and trachea were lined with an organised cast.

Without venturing to go so far as Dr. Richardson has gone, I cannot help thinking that his views regarding the existence of a fibrinous clot in the heart in certain cases of croup demand serious attention; and, as I once strongly opposed them, I am now happy to admit that I am, in a measure at least, converted to his side.

I am, &c. HENRY SMITH.

Caroline-street, Bedford-square.

REPORTS OF SOCIETIES.

THE OBSTETRICAL SOCIETY OF LONDON.

WEDNESDAY, DECEMBER 7, 1859.

Dr. RIGBY, President, in the Chair.

THE gentlemen proposed as Honorary Fellows at the last meeting were duly elected. Twelve gentlemen were elected, and twelve proposed for election, as Ordinary Fellows.

A paper, by H. W. BAILEY, F.R.C.S., was read
ON STATISTICS OF MIDWIFERY PRACTICE, FROM
JULY 2, 1808, TO DECEMBER 31, 1858.

In order to afford an opportunity of comparing provincial statistics with those of town and Hospital practice, the author submitted the results of fifty years' extensive practice in midwifery. The births amount to 6476—3290 males, and 3186 females. There were 53 cases of twins—63 males, and 38 females; 21 were still-born. There was 1 case of triplets, which lived till the next day. There were 6120 cases of head-presentations, and 356 preternatural cases. Presentations of the face to the right side were very tedious; in such cases, turning or the use of the forceps was advisable. In 44 cases the arm or hand presented. In 21 the funis presented; 1 or 2 of these were still-births. Of breech cases, 45; when the face presented to the front these cases required the aid of the forceps to save the child. In 40 cases the face, and in 9 the abdomen or back, presented. In 180 cases (primary) the feet presented. In 17 cases placenta prævia existed. In 1 the placenta was expelled first. As a rule, the author dilates gradually and turns in these cases. All cases were successful, both to mother and child, if at the full time. Hæmorrhage was fatal in two cases, attended by midwives. There were 2 cases of sudden death after labour; no apparent cause. Embryotomy was performed only twice. A tabular statement was appended, showing the number of deliveries in the respective months of the year.

A paper, by Dr. CHARLES WALLER, was read concerning a
CASE IN WHICH THE DELIVERY OF A VERY
LARGE LIVING CHILD WAS EFFECTED BY
MEANS OF THE LONG FORCEPS.

The case was brought forward on account of the extreme size of the child, which on delivery, was found to weigh 15lbs. 15oz. After about 36 hours ineffectual labour, Dr. Waller applied the long forceps, a good part of the head being still above the brim, and delivered the child, which was a female, alive.

A NEW NURSING-CRADLE
was then exhibited by the Inventor, Mr. C. WRIGHT.

A paper by Dr. ROBERT BARNES was read on

THE RISK TO LIFE OF FIRST AND SUBSEQUENT PREGNANCIES.

The author wished to draw the attention of the Society to the determination of the question as to whether first pregnancies were to be considered as more hazardous to life than subsequent ones. The question was one of great interest as bearing upon life assurance. It was not sufficient to know the amount of risk for all pregnancies, which we were at present, indeed, in possession of. Excluding deaths from puerperal fever, the Dublin Hospital statistics showed that 1 in 100 of primiparæ died, and 1 in 200 of the multiparæ. But as the statistics of private practice only were capable of affording satisfactory information, he would suggest that the Fellows of the Society be invited to contribute to the settlement of the question. A tabular form for the purpose he submitted to the Society.

Dr. TYLER SMITH agreed with Dr. Barnes as to the risk incurred by women in first labours, but it was the custom of the insurance office with which he was connected—the New Equitable—to assure the lives of healthy women pregnant for the first or any other time at the ordinary rates. The rates of life assurances were framed upon the average duration of life in average lives. At all ages, the expectancy of the continuation of life was somewhat greater in the female than the male; so that they were the best lives for assurance. As regarded the question of married or single women, there could be no doubt that there were certain risks incidental to child-birth, but single and childless women were subject in an increased degree to certain disorders of the nervous system, and to uterine and ovarian tumours, which rendered them, if anything, less eligible than child-bearing women for life assurance.

Dr. MURPHY believed the principle of the New Equitable Society to be the correct one. The statistics of the Dublin Hospital were not applicable to the settlement of this interesting question for special stated reasons; and, in fact, arguments based on statistics generally required to be received with very great caution.

A paper by Dr. ANCELL BALL was read on

THE TREATMENT OF MOLES AND PREMATURE EXPULSION OF THE FŒTUS.

In cases of severe hæmorrhage after the expulsion of the fœtus, the secundines being retained, the author uses one of three instruments exhibited, for the purpose of removing the retained substance. The instruments consist of a two- and a three-bladed forceps, which admit of being used through the speculum.

A paper by Dr. HENRY OLDHAM was read on

A CASE OF RETROFLEXION OF THE GRAVID UTERUS DURING LABOUR AT TERM.

The patient was pregnant for the first time, and had been in labour for several hours when Dr. Oldham saw her. On examination, the fundus uteri, with the head of the child, were found filling the pelvis; the os uteri drawn up above the pelvic brim, and reached with the utmost difficulty. The condition had apparently existed from the beginning of pregnancy. By combined external and internal manipulation the breech was brought down, and the fundus pushed up. Delivery was then effected; the child was dead. The mother did well. The author remarked on the facts—1st, That the full time had been reached; 2nd, That the symptoms were not such as to excite attention previously; and 3rd, The possibility of replacement at this late period. In answer to a question put by Dr. Graily Hewitt, the author stated that the patient, when formerly under his care and single, had he believed, been the subject of retroflexion.

A paper by Dr. W. O. PRIESTLY was read on
SLOUGHING OF THE FŒTAL SCALP AS A RESULT OF IEDIOUS LABOUR.

The author related a case under the care of a midwife in which the head had been impacted for about forty-eight hours in the pelvis, in a first labour. Eight days after delivery the child died. On the third day, the back of the head was much inflamed, later the scalp assumed a darker colour, and the

child gradually sank. A slough, of the size of a shilling, had separated, leaving a wound which extended nearly to the bone, over the occipital protuberance, and there was extensive ecchymosis around almost to the ear on each side, and the pericranium was in part separated from the bones. The sloughing in question resulted, in the author's belief, from the long impaction of the head in the pelvis.

A paper by I. BAKER BROWN, F.R.C.S.E., was read on—

A CASE OF FIBROUS TUMOUR OF THE UTERUS, ILLUSTRATING A SURGICAL OPERATION FOR ITS CURE.

In a woman, aged 49, ill for six years, there was found an abdominal tumour, extending half-way to the umbilicus, composed of the uterus, enlarged by the presence of a fibrous tumour. The os uteri was incised, and the tumour brought into sight. The author then proceeded to operate upon it by piercing it in the centre, cutting out a portion, much in the manner of coring an apple. Through the cavity thus formed as much as possible of the surrounding tissue was broken down. A copious discharge occurred for the next few days; and at the end of four months a slightly enlarged uterus was all that could be detected. The principle on which the operation in question (which, the author observed, had been performed by Atlee and Recamier) was adopted, was the knowledge of the fact, that when polypi are ligatured the whole of the growth perishes—not only that on the distal side, but also that on the other side of the ligature. By removing a portion of the fibrous tumour, the same effect—the destruction of the whole—was in this case obtained.

Dr. BARNES believed Atlee's operations had been attended with great mortality. He would suggest that Dr. Simpson, just elected an Honorary Fellow, should furnish the Society with the results of his enucleation practice.

Dr. PRIESTLY believed that Dr. Simpson had abandoned interfering with large fibroid tumours of the uterus by operative measures.

The PRESIDENT remarked on the varying degrees of the menorrhagia attending cases of fibroid tumour.

A paper by Dr. WM. TYLER SMITH was read on a

CASE OF EXTREME EMACIATION, THE RESULT OF OBSTINATE VOMITING IN PREGNANCY.

A girl, aged 19, unmarried, was admitted into St. Mary's Hospital in July last. Obstinate vomiting, at first supposed to depend on cerebral disorder, continued from the time of her admission. She became so extremely reduced in flesh, that at the end of six weeks her weight was only forty-seven pounds and a-half. At this time she was unable to move in bed; delirium was frequent, bed-sores appeared over the sacrum and nates, and she appeared to be dying. Pregnancy was now suspected. The catamenia were found to be absent; the breasts were full, notwithstanding the emaciation of the rest of the body, and the uterus had increased in size. Remedies had been of no avail. She was too weak to allow of artificial abortion. A nurse was put by her bedside to give her a single teaspoonful of nourishment every half hour. The body was rubbed with oil, and beef-tea injections were administered. Under this plan the sickness ceased; the quantity of nourishment was slowly increased, and she improved in strength, and became comparatively stout. Pregnancy went on to December 3, when she miscarried at the fifth month, and is now recovering.

In answer to a question by Mr. CLEVELAND, Dr. W. TYLER SMITH stated that the enmata given were retained.

A paper by Dr. RICHARD HODGES was read

ON A CASE OF HYSTERIA SIMULATING IN THE MOST PERFECT DEGREE NATURAL LABOUR.

The author was engaged to attend a woman said to be in the fifth month of pregnancy. Four months afterwards he was sent for, the patient being stated to be in labour. The pains were found to be severe, and like those of the last stage of parturition. On examination, however, a tumour was found to present, which turned out to be the bladder, distended and prolapsed. There was no pregnancy.

The PRESIDENT then announced that the first session of the Society, which had been a most successful one, was now brought to a close. The first meeting of the next session would be held on Wednesday, January 4, 1860.

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS.—The following Members of the College having been elected Fellows at previous meetings of the Council, were admitted as such on December 8th :—

Blakeney, Edward Hugh, Brunswick-square
Beckingsale, John Edgar, Newport, Isle of Wight
Camps, William, Park-street, Grosvenor-square
Cartwright, Samuel, Burlington-street
Clarkson, William Nicholson, Whitby
Clarke, Benjamin, Hackney
Harston, Alfred Dew, Islington
King, Osmer, Greenwich
Michell, Slyman, Truro, Cornwall
Mosely, George, Gower-street
Oxley, Robert, Pontefract
Smart, James, Cambridge-heath
Smith, Thomas Hickstall, St. Mary Cray, Kent
Stewart, John, Wolverhampton
Williams, John, Bengal Army
Wilkinson, Charles Nelson, Wandsworth

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 8th of December :—

Curtis, William, jun., Alton, Hants
Duke, Stephen, Chichester
Jameson, George William, Caistor, Lincoln
May, John Henry Square, Plymouth, Devon
Travers, William, Poole, Dorset

The following gentlemen also on the same day passed their First Examination :—

Adams, Thomas Rutherford, Kilkenny, Ireland
Gannon, John Palmer, University College Hospital
Harding, John Alfred, Bath, Somerset
Mallett, William James, Bolton-le Moors
Walker, William Holmes, Romford
Williams, Evan Evans, Llandyssil, near Carmarthen

APPOINTMENTS.

BENTLEY.—Mr. Robert Bentley, F.L.S., Professor of Botany and Materia Medica to the Pharmaceutical Society of Great Britain, has been appointed Professor of Botany in King's College, London, as successor to the late Mr. Henfrey.

WING.—Dr. Edwin Wing, of the Fisherton Asylum, is appointed Superintendent of the Northampton Asylum.

DEATHS.

CARFRAE.—December 12, James Henderson Carfrae, of Otley, Yorkshire, aged 48.

CROSBY.—December 1, John Crosby, of Great Ouseburn, Yorkshire, aged 62.

MACDOWELL.—September 20, at Melbourne, John Macdowell, M.D.

MAIN.—Lately, at Bloem, Fontein, South Africa, Augustus Main, Surgeon and Justice of the Peace for the District of Middleberg, South Africa.

RUMLEY.—December 10, at Paris, Henry William Rumley, Surgeon in the Bengal Artillery, aged 42.

SIMMONS.—November 14, at Estry, John Simmons, Surgeon (in practice prior to 1815), aged 86.

SPRY.—December 5, Joseph Hume Spry, of Bath (where he had practised for upwards of half a century), M.D. aged 81.

TURNER.—November 23, at Gattenside-villa, Dr. William Turner, R.N., aged 78. He entered the service very young and was in several engagements. He assisted after the battle of Trafalgar in extracting the fatal ball from Lord Nelson's shoulder.

PARIS MEDICAL STUDENTS, 1859.—This year, 983 inscriptions have taken place at the Faculty of Medicine, viz. : 922 for the doctorate, and 66 for *officier de santé*. Of the 983 inscriptions, 304 are new, being 53 more than in 1858.

THE INSANE COLONY AT GHEEL.—Two Inspectors of Lunatic Asylums, sent as a Special Commission by the Dutch Government to examine into the Belgian Lunatic Village at Gheel, have reported in favour of forming a similar establishment, on a small scale, in Holland.

RARE CAUSES OF DEATH.—The Registrar-General for Scotland says :—“A female, 18 years of age, died from tetanus, which followed the unusual occurrence in this country of frost-bite in both feet. A married female, aged 35, died from exhaustion, produced by excessive vomiting from pregnancy. A male child, two months old, was suffocated in its mother's arms, from being too closely wrapped up in a shawl to protect it from the inclemency of the weather when out. And a labourer in a chemical work was accidentally suffocated with the fumes of sulphurous gas.”

MILITARY SURGERY AND HYGIENE.—As arrangements are now in progress at Chatham for carrying out a well-organised system of instruction on these subjects, and on Tropical Medicine, by an established Army Medical School, Dr. James Bird has intimated to the Governors of St. Mary's Hospital his intention of discontinuing, from the 1st May next, the lectures on those branches of instruction given by him to the pupils of that school since its foundation. The Governors and his colleagues have passed a vote of thanks to him for the able manner in which he has performed his duties.

TESTIMONIAL TO MR. OGILVIE.—A gratifying tribute of regard, in token of his great kindness, was, on Friday, the 25th inst., presented to Mr. William M. Ogilvie, late Surgeon on board Her Majesty's Ship *Trident*. The testimonial consists of a massive gold medallion, contributed by the entire ship's company, with the exception of two of the officers. The medallion is stamped within the two circles of the front and adverse sides with the following inscription :—“*Palmam qui meruit ferat*. Presented to W. M. Ogilvie, Esq., Surgeon, R.N., by the officers and ship's company of Her Majesty's Ship *Trident*, Woolwich, November, 1859, in gratitude for the noble manner in which he performed his trying duties during the frightful yellow fever that raged on the West Coast of Africa in May, June, and July, 1859.”

THAMES WATER.—It is certainly an interesting question, how long ago it is since the dear, old, unsavoury river had a taste of pure water. The following remark of Pierce Penilese would seem to imply that three centuries must have passed since Father Thames had that happiness, unless the remark is to be construed as implying an impertinence respecting beer :—“The next object that encounters my eyes,” wrote Pierce anent, “the pride of peasants sprung up of nothing,” “is some such obscure gallants as, without desert or service, are raised from the plough to be checkmate with princes; and these I can no better compare than by creatures that are bred *sine coitu*, as crickets in chimneys; to which I resemble poore scullions, that, from turning spit in the chimney corner, are on the sodayne hoysed up from the kitchen into the waiting chamber, or made barons of the beanes, and marquesses of the mary-boanes: some by corrupt water, as gnats, to which we liken brewers, that by retayingling *filthie Thames water*, come in few yerres to be worth fortie or fiftie thousand pounds,” &c.—(*Pierce Penilese his Supplication to the Devil, describing the overspreading of Vice, and the suppression of Virtue. Pleasantly interlac'd with variable delights, and pathetically intermixt with conceited reproofes. Written by Thos. Nash, Gentn. 1592. Shakspeare Society's Ed., 1842, p. 21.*)—The antiquity, or, to speak more correctly, the chronic character of Old Father Thames' evil state, if admitted, would be no justification for our neglect of it, and we must persist in our efforts to relieve him.

WOORARA.—The assertion that woorara is not poisonous when taken into the stomach, though generally received as correct, does not, it seems, appear to be so. The mucous membrane of the stomach is a bad absorber of the poison, but if a large dose of it is taken into the stomach, the poison will destroy life. In 1854 M. Velpéau poisoned in this way frogs, toads, tritons, and even certain mammiferæ. M. Bernard, in 1856, poisoned a dog fasting, by introducing into his stomach a solution of woorara; and he showed that the absorption took place more rapidly when the stomach was empty. Then, again, M. Pelikan, in 1857, told the Academy of Sciences :—“That the watery solution of woorara introduced into the stomach by means of a gum-elastic catheter, acts as a poison, though more slowly; and thus confirms previous experiments.” Large doses are required; 4, 6, and 8 grains being required to kill rabbits, pigeons, and guinea-pigs.

SIR C. BELL.—“How strange a thing that the first complete biography of one of the most eminent Surgeons that Great Britain ever produced should be written by a Frenchman! The second edition of ‘The Life of Sir Charles Bell,’ by Amédée Pichot, is just announced for publication—the first having been eagerly caught up by the great man's admirers on the Continent. The work in itself is singularly well written, and deserves the brilliant success it has met with. It professes to be a history of the life and labours of Sir Charles Bell. The latter are perhaps better known, and consequently better appreciated, on the Continent than with us; for while each discovery made by the first reasoning practitioner of the age was giving rise to the jealous doubt and

envious cavillings of his rivals at home, it was at the very same moment being eagerly adopted by the Medical Schools of Paris and Berlin, and both Roux and Dupuytren were holding up his name to their numerous pupils as the beacon-light on which their eyes were to remain fixed, while they were groping their way through the doubt and difficulty which prevent the attainment of 'result' in Medical science. At the present moment a vast spirit of inquiry has arisen in France concerning the right assumed by science in England to claim an equal share of the world's gratitude with that of France, and the publication of this 'Life of Sir Charles Bell' has done a great deal to dissipate the ignorant opposition with which such claim has sometimes been met. Society, the only rightful judge of Medical skill, and whose judgment, being founded on self-interest, is seldom in fault, has chosen in France to adopt the renown of many a British physician with as much good-will as that accorded to those belonging to the French school. *Buchan and James (!)* in the last generation—Simpson and Clark in our own—are as well known and frequently quoted as the most popular professors of the Académie de Médecine. The artists of Paris have eagerly seized upon the most striking passages in that portion of M. Pichot's work which treats of the study of anatomy as applied to expression in art, and the artistic journals have been of late much occupied, some in explaining and others in refuting the theory of which Sir Charles Bell has been the discoverer and enthusiastic promulgator. M. Amédée Pichot merits our warmest admiration and gratitude for the manner in which he has executed his task. Full of enthusiasm, as every biographer should be, for the talents of his hero, he has taken the utmost pains to make his reader share in this enthusiasm by rendering clear and lucid the reasons upon which it is founded—and few could rise from the perusal of his work without feeling the same degree of admiration for Sir Charles Bell as he so warmly expresses. Such works as these, whose object it is to make known to one nation the great men of another, are invaluable in preaching the bond of brotherhood between them, and in displaying the universal sympathies of genius, which recognise no obstacle of man's creating, but proclaim at once the tie by which the human race is bound together."—*Morning Star*.

VITAL STATISTICS OF LONDON.

Week ending Saturday, December 10, 1859.

BIRTHS.

Births of Boys, 920; Girls, 918; Total, 1838.
Average of 10 corresponding weeks, 1849–58, 1584.5

DEATHS.

METEOROLOGY.

From Observations at the Greenwich Observatory.

Mean height of barometer	29.923 in.
Mean temperature	41.3
Highest point of thermometer	55.5
Lowest point of thermometer	26.9
Mean dew-point temperature	38.9
General direction of wind	Variable
Whole amount of rain in the week	0.41
Amount of horizontal movement of air in the week	1903 miles.

TO CORRESPONDENTS.

In the First Volume of the

Medical Times and Gazette

For 1860,

D.R. SIMPSON'S

CLINICAL LECTURES ON THE DISEASES OF WOMEN

WILL BE CONTINUED, INCLUDING

OCCASIONAL CLINICAL LECTURES ON CASES IN OBSTETRIC SURGERY.

CRANIOCLASM—A NEW FORM OF CRANIOTOMY.

FIBROID TUMOURS AND POLYPI OF THE UTERUS.

INFLAMMATORY AFFECTIONS OF THE UTERUS AND VAGINA.

DISPLACEMENTS OF THE UTERUS.

DISEASES OF MENSTRUATION.

PHYSICAL DIAGNOSIS OF DISEASES OF THE UTERUS, OVARIES, ETC.

SURGICAL OPERATIONS ON THE VAGINA AND PERINEUM.

In the same Volume,

A SERIES OF PAPERS WILL APPEAR

BY DR. CONOLLY,

ENTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE:

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,

SENILE INSANITY,

VARIETIES OF INSANITY WITH PARALYSIS,

UTERINE AND OVARIAN CASES,

With special relation to their Causes, as—

INTEMPERANCE,

UNSUITABLE STUDIES,

FANATICISM, ETC., ETC.

Other arrangements are in progress, calculated to make forthcoming volumes more useful and popular than any of their predecessors.

Mr. Simpson's paper shall appear next week.

Dr. Russell's Case of Tracheotomy shall appear in an early number.

Dr. Cotton's paper on the Action of Iodide of Potassium upon Phthisis shall appear next week.

Papers and letters by Dr. Doig, Mr. Lawrence, Emeritus, etc., etc., are in type, but are unavoidably postponed.

Mr. Hitchman.—We have repeatedly advocated the principles of sewerage so ably supported in the paper sent, and our readers are quite familiar with them.

The case of Angina Pectoris, reported last week (page 591) in the proceedings of the Western Medical Society, was brought forward by Dr. Aldis. The author's name was accidentally omitted.

E. C. B.—For a Doctor, or Licentiate in Medicine, of Great Britain, who desires to occupy the same grade in one of the three Faculties of France, it is required that he submit to all the regular trials demanded of the native of France; that is to say, he must undergo five examinations and write a Thesis, either in Latin or French. Before, however, being admitted for examination, he must address a letter to the Minister of Public Instruction in order to obtain a *dispense*, or exemption from the inscriptions required each year of French students, and some three minor examinations exacted of the students during the course of their studies. This demand is forwarded by the Minister of Public Instruction to the Faculty, and if a favourable answer be given, the *dispense* is granted. The *droits universitaires* to be paid for the M.D. of Paris amount to 1260 francs (equal to about £50). The degree of M.D. can be obtained at the Faculties of Montpellier or Strasbourg, as well as at Paris. The *status* of the last mentioned is the highest.

First Examination.—Anatomy and Physiology (with Dissection).

Second Examination.—Pathology with Operations.

Third Examination.—Natural History as bearing on Medicine, Natural Philosophy (Medical) Organic Chemistry and Pharmacy.
Fourth Examination.—Hygiene, Legal Medicine, Materia Medica, and Therapeutics.
Fifth Examination.—Clinical Medicine (at the bedside) as well as "Clinique externe," Accouchements.
Thesis in Latin or French.

ERRATA.—Page 591, col. 1, line 32, for "right ovary" read "left ovary." Page 592, Royal College of Surgeons, Examination for the Diploma, read "Terry, Joseph Garside, Wittersham, Kent." Such mistakes constantly occur, as the College furnishes no official lists to the Journals.

DOCTORS AND PHYSICIANS.

Dr. Parsons says:—"Lord Chief Justice Coke considered Licentiates of the London College of Physicians as Doctors of Physic. He thus speaks of them in his *dictum* on Dr. Bonham's case—"Much was said in commendation of the Doctors of Physic of the College in London, and somewhat in derogation of the Doctors of the Universities; he attributed much to the Doctors of the said College, &c.; so that, in addition to the judgements of Ellenborough, Mansfield, and Denman, 'that Physicians are Doctors,' we have the *dictum* of another legal Don—a no less person than Lord Chief Justice Coke."

CLEABY AND OSMEROD.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Can you by any chance tell me what is the Journal referred to by M. Broca in the following words of his, as reported in the Gazette des Hôpitaux?—"On lit dans le Journal britannique de Cleaby, tome xiii. p. 85." I am, &c. S.C.

P. S.—Who also is M. Osmerod of Brighton?

SALE OF POISONS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your last week's Journal, you referred to the disgusting double suicide case, in which a young man and woman had destroyed themselves by prussic acid. The jury in their verdict do not seem to have troubled themselves, by inquiring where these people obtained the poison. Is this not another proof, to be added to the many already given of the necessity of the Legislature interfering, to prevent the indiscriminate sale of poisonous drugs? I am, &c. I.T.A.

December 14.

ALCOHOL IN THE BLOOD.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—A communication has lately been made to the Académie des Sciences, in which it has been lengthily pointed out that alcohol passes from the digestive surfaces directly into the blood. This fact is looked upon as a positively novel discovery by the gentleman who gave in the Report; so you will, therefore, perhaps, permit me to remark that a demonstration of the fact was given in the year 1837, by Dr. Percy, when he was a student in Edinburgh. He distilled pure alcohol from the brain of a man, who died in the Edinburgh Hospital shortly after drinking off a bottle of neat whiskey. I am, &c. IN VINO VERITAS.

OUR PHYSICIANS.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—In your last number you stated that the College of Physicians of London are about to inform the Authorities of the Medical Charities of England, that the term of Licentiate is henceforth converted into Member of the College. May I take the opportunity of suggesting that this would be a good opportunity for enlightening the aforesaid Authorities, concerning the value of the Licence of the College of Physicians of Edinburgh? According to the laws of most of our Hospitals and Dispensaries, Licentiates of the Edinburgh, have the power equally as the Licentiates of the London College, to present themselves as Candidates for the office of Physicians to such Institutions. This state of things will evidently sooner or later lead to collisions, for it is clear that a vast number of the General Practitioners of this country have now the power of becoming Physicians to our Hospitals, in consequence of their having made themselves masters of the Edinburgh Licence, by the payment of a ten-pound note. Perhaps, as all things are so rapidly changing in the scientific, political, and other worlds, this change in the polity of our Profession may also be for the best; but we at least should understand how it is to be when the pinch comes. I am, &c. V.S.

December 15.

CAUTION TO MEDICAL MEN.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—The following lines may serve as a caution to Medical authors, and I trust, therefore, that you will insert them for the benefit of the Profession.

In September last I received a note couched in the following terms:—"James Becke presents his compliments to —, and desires he will have the goodness to forward him per post, two copies of his work on —; and J. B. will remit post-office order for the amount thereof.
"17, Sidney-street, Oxford-road, Manchester,
"September 10, 1859."

I foolishly sent the books, thinking the person who thus introduced himself, to be a respectable Medical Man, but of course, no post-office order arrived. I then caused inquiries to be made at the above mentioned address, and the following reply was sent:—"Dr. —, has been cheated by a vagabond. The address given, is that of a lodging-house, where the fellow lived for a very short time only. The woman in the house said, that he was a 'naughty man.' They don't know anything about him there." Leaving these facts to speak for themselves, I am, &c. M.D.

POOR-LAW MEDICAL REFORM ASSOCIATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Mr. Paul Jones has again addressed you on the subject of the Poor-Law Medical Reform Association, and writes of "a well-considered and matured plan, acceptable to ourselves and reasonable and feasible

too in the eyes of Guardians and Poor-Law Board." Surely Mr. Paul Jones will not object to lay before the public so inestimable a blessing, as I honestly confess my plan does not offer that boon; though from the letters I daily receive, I believe it is one that meets the views of a large body of the Poor-Law Medical officers. Mr. Paul Jones accuses me of not telling him "what constitutes membership, or how the committee was appointed;" therefore, permit me to say, any Union Surgeon subscribing becomes a member of the Association; and that the Committee, with the exception of three or four, were all appointed at a general meeting held at the Freemasons' Tavern. Mr. Paul Jones also writes of "a real and simple organisation," and that "Mr. Griffin is just the man to do it if he will but set about it." Surely Mr. Paul Jones will tell me what he means by a "real and simple organisation," or how can I set about doing what he requires? Mr. Paul Jones had better enter the lists fairly, and sign his real name to his next letter, and then we shall be on equal terms, and the Poor-Law Medical Officers will know in whom they may place confidence. Weymouth, December 13. I am, &c. RICHARD GRIFFIN.

THE ADVERTISING MANIA.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You have recently published articles on "Professional Charges," which have been duly pondered by needy Physicians and the large body of General Practitioners. Our French brethren have taken hold of the vexed question with boldness, and declared that "the whole scale of charges must be at once heightened, in order to meet the exigencies of the times."

—Hard times!
You have also exposed the Aural Empiricism and Advertising Quackery of this "enlightened" age; and perhaps the accompanying extract from the advertising columns of *The North London Record* (an Islington local journal), may suggest a remedy for the present evils of Medical charges, (!) while at the same time it will add another item to the catalogue of abuses which your valuable Journal so honestly protests against.

"The North London Medical and Surgical Institution, late 174, Upper-street, Islington, for affording first-rate (!) Professional Advice to persons of limited income. The tenancy of the house, in which this Institution has been hitherto located, having terminated, and more commodious premises being thought desirable, the Patients will be received at 46, Florence-street, Upper-street, Islington, (close to the Vestry Hall,) till permanent arrangements are made. Hours of Attendance: From 9 a.m. till 4 p.m., and from 6 till 8 p.m., except Saturdays, when the Institution is closed at 1 o'clock. Fee, for Consulting the Physician or Surgeon, Two Shillings, including the necessary Medicines. Children and Domestic Servants, One Shilling."

Who are these first-rate philanthropic economists?

I am, &c. OBSERVER.

COMMUNICATIONS have been received from:—

PROFESSOR SYMPSON; Dr. CONOLLY; Dr. WEST; Mr. TEALE, Leeds; Mr. BOWMAN; Mr. WILDE, Dublin; Dr. RUSSELL, Birmingham; REGISTRAR-GENERAL, Edinburgh; Dr. ALDIS; Mr. FRANCE; Dr. HILLIER; Dr. COTTON; Dr. NOBLE; Dr. FAIRLESS; Mr. SYMPSON, Lincoln; REGISTRAR-GENERAL; Mr. HITCHMAN; Mr. HAMILTON; Mr. LEPAGE; Mr. ROOK.

APPOINTMENTS FOR THE WEEK.

December 17. Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

19. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

MEDICAL SOCIETY OF LONDON, 8½ p.m. Dr. H. Hyde Salter "On some points in the Clinical History of Asthma."

20. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m. (Council Meeting 7 p.m.)

21. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopaedic Hospital, 2 p.m.; Middlesex, 1 p.m.

ETHNOLOGICAL SOCIETY, 8½ p.m.

22. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m.; London, 1½ p.m.; Great Northern, 2½ p.m.

ROYAL SOCIETY, 8½ p.m.

23. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

By Mr. Fergusson—Division of Cicatrix after Burn; Removal of Growth from Eyelid; Radical Cure of Hernia; Removal of Malignant Growth from Hand. By Mr. Bowman—Removal of Necrosed Bone from Tibia.

Mr. Jones' Elastic Uterine Truss.—

This Truss combines in its construction strength, lightness, and elasticity, is easy to wear, and efficient in its application. It affords great relief in cases of Uterine Pain, often occurring from relaxation in delicate females, and is of inestimable value in all cases of Prolapsus Uteri, rendering the use of pessaries entirely unnecessary.

N.B. Apply to the Inventor, Mr. Jones, Surgeon, 43, Friargate, Derby, or to Messrs. Longdon and Co., Wholesale Manufacturers, Derby.

Pillischer's Achromatic Microscopes.—

To meet the daily increasing demand for his Microscopes, M. PILLISCHER has recently completed extensive alterations in his workshops to enable him to manufacture MICROSCOPES and their Object Glasses upon a more expeditious and extensive scale. M. P. has the pleasure of informing the Profession that he is now able to furnish Microscopes of the very greatest perfection; possessing every modern improvement; and with Object Glasses of a quality unsurpassed by any other maker, on the shortest notice, and at very moderate prices.

PILLISCHER'S 27 1/2s. STUDENTS' MICROSCOPE, for which a Prize Medal was awarded to him at Paris Exhibition, 1855, deserves particular notice. It consists of a well-constructed Stand, with coarse and fine adjustments, a capital Stage, with Diaphragm and Large Mirror, one Eye-glass, one and one quarter inch Object Glasses, 16° and 75° angular aperture, and a neat Mahogany Case about 7 in. square. The above, Microscope when further completed with the addition of a Second Eye-glass, Condenser for Opaque Objects, Live Box, Stage Forceps, large Glass Stage, and Polarising Apparatus, price £10, forms a most complete and valuable Microscope, and in every respect as useful as a much more expensive one.

A Catalogue post free on application to M. Pillischer, Optician, 88, New Bond-street, London, W.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh, Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman, Montgomery, U.S.; and many others.—See Professor Simpson's Lecture, Medical Times, January 1st, 1859.

To Surgeons, Dentists, etc.—The Best

HOUSE in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard House, 78, Farringdon-street, City.

Established upwards of a Century.
A large Stock of New Instruments always on Sale, all Warranted.
Instruments Bought, Sold, or Exchanged.
N.B.—The largest Stock of Second-hand Dissecting Cases in London.

Ford's Eider-Down Jackets for Invalid

LADIES, Young Persons of Delicate Constitution, and all who suffer from cold, to whom they are a great comfort. No other article is so light and warm; it is, therefore, a desideratum to ladies recovering from illness, as also to those used to hot climates, while for travelling or wear in the carriage during cold weather it is indispensable. Superfine cloth Cashmere lined Silk, Eider-down quilted, price Two Guinea. Sent, post free, on receipt of Post-office order and the size round chest under arms.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Ford's Aixa Jackets, with sleeves

à la Zouave, open to the corsage, may be had plain or beautifully embroidered; price in cloth, 21s.; Velvet, 42s. and 63s. The half-guinea cloth Jacket, for in or out-door wear, surpasses every one for cheapness and style. Patterns and Pictures of any of the above sent free to all parts of the world.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultrices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORD-BURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atrop, Belladonna, Cottedon Umbilicus, etc.) Also to his Liq. Taraxaci, Liq. Galli Aparinis (a valuable alternative), Liq. Parietariæ (diuretic), and Liq. Belce (prepared from the *Ægle Marmelos*, or Indian Bael), for dysentery and diarrhæa. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square. BOUDAULT'S PEPSINE imported in original bottles. *Est. Lucris Europ.*

Those who cannot swallow Cod-Liver

OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—"The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered."—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the "PULVIS JACOBI VER. NEWBERRY'S") 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

To Students and others.—You will do

well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Great Saving in the Purchase of New

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, &c.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

W and A. Gilbey, Wine and Spirit

• IMPORTERS and DISTILLERS, are now doing by far the largest trade of any other house in the Kingdom, their connexion exceeding at the present time 15,000 private families and more than 50 of the most important Hospitals, Military Messes, and Public Institutions; they beg to offer the following advantages to consumers.

WINES FROM THE CAPE OF GOOD HOPE.

PORT, SHERRY, MADEIRA, MARSALA, all First Growths, 20s. per dozen, £3 6s. 6d. per 7-gallon cask, £6 11s. 3d. per 14-gallon cask, and £12 19s. per quarter-cask of 28 gallons.

They are pure, delicate, wholesome, and in every way suitable for either dinner or dessert.

The Custom House Returns for 1858 show that W. and A. G. paid duty on the unprecedented quantity of 56,635 gallons of these wines alone in that year.

WINES FROM PORTUGAL.

Fine Old PORT from the Wood 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

This, our leading article from Oporto is the old school of mature silky Port from the wood, with body and bouquet. This is more palatable and wholesome than those extremely high-priced Old Bottled Wines, which have nothing left to recommend them but vegetable decay.

WINES FROM SPAIN.

SHERRIES, Pale and Golden, at 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

The almost total disappearance of the Vine Disease in Spain, enables us to import an extremely good wine at this price; it is a decided improvement on former shipments.

WINES FROM FRANCE.

CLARETS at 24s. and 88s per dozen. These, our leading importations of *Vin Ordinaire*, are superior to those generally drunk in France, and we guarantee them decidedly superior to any other offered at anything like these prices. They are shipped to us direct from the Vineyards, under the superintendence of one of the leading Bordeaux Houses.

CHAMPAGNE, 37s. 6d. per dozen. Having made a large contract to have this wine shipped direct from the vineyards, we are enabled to submit it not only as the cheapest imported, but as good as any gentleman can desire to have on his table.

WINES FROM SICILY.

MARSALA, 24s. per dozen, £4 0s. 6d. per 7-gallon cask, £7 19s. per 14-gallon cask, and £12 7s. 6d. per quarter cask of 22 gallons.

This is Ingham's superior, and is often preferred to even middling-class Sherries, and the quality is guaranteed.

SPIRITS.

COGNAC BRANDY, finest	25s. per gallon.
GIN, the old English	11s. "
WHISKEY, Pure Old Irish	16s. "
" Old Scotch	16s. "
RUM, Old Jamaica	14s. "

A dozen full-sized bottles of any of the above Wines at the quoted prices, or for 5s. in stamps a dozen small samples, or any two samples for 12 stamps, sent securely packed and labelled.

A detailed Price-List of other Wines, Spirits, and Liqueurs sent on application.

In England Cheques to be crossed to our Bankers, the Bank of England, and Post-office Orders made payable to the General Post-office, London; in Ireland the Bank of Ireland, and General Post-office, Dublin; in Scotland the Bank of Scotland, and General Post-office, Edinburgh.

W. and A. GILBEY, 357, Oxford-street, London; 31, Upper Sackville-street, Dublin; 12, St. Andrew's-square, Edinburgh.

South African Sherry, 19s. 6d. Port,

22s. Claret, 18s. Madeira, 24s. Amontillado, 26s. Cognac, 18s. 6d. Her Majesty's Wine Merchant. Specially appointed since May, 1840. JAMES MARKWELL, Cellars, 35 to 40 & 45, Albemarle-street—Offices, 40, Albemarle and 4, Stafford Streets. Ports, from 30s.; Sherries, 30s.; Madeira, 42s.; Hocks, 40s.; Moselles, 40s.; Sparkling Hocks and Moselles, 48s.; Ditto, St. Peray, 54s.; Ditto, Burgundy, 60s.; Clarets, 28s.; Chablis, 38s.; Cote Rotie, 48s.; Champagne, 44s.; Sauterne, 40s.; Ditto, Yquem, 80s.; Essence of Turtle Punch, 56s.; Old Tom, 11s. 6d. All kinds of Foreign Spirits and Liqueurs. Particular and direct Shipments of Montilla, Vino di Pasto, Amontillado, Oloroso, Xres Viejo, Manzanilla, Longworth's Sparkling and Dry Catawba American Peach Brandy; Monongahela and Bourbon Whisky; and Sole Agent for the Celebrated Yankee Bitters. Bottled Stock for inspection, 6000 dozen. Cash or Reference. As usual, very liberal prices given for genuine Old Bottled Wines. Half-pints of first-class Champagne only.

N.B.—A considerable quantity of the Old Bottled Wines removed to Mr. M.'s Stock from Long's Hotel, North and South American Coffee House, Shugborough Park, and the celebrated Reading Sale.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of

BERRY, BROS, and CO. 3, St. James's-street, London.

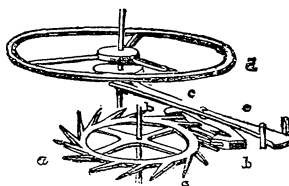

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 17s. net Cash.—

• This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Farnival's Distillery, Holborn.

LEVER ESCAPEMENT.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

Benson's WATCHES.

"Perfection of mechanism."—Morning Post.
Gold 4 to 100 guineas.
Silver 2 to 50 guineas.
Send two stamps for Benson's Illustrated Watch Pamphlet.
Watches sent free to any part of the Kingdom on receipt of a remittance.

Scammony Manufactured from the

ROOT.—This Pure Resin may be had of all Wholesale Druggists at 25 per cent. under the price of the best Virgin Scammony. And the superiority of its quality was fully explained at a meeting, of the Pharmaceutical Society, and reported at length in their Journal of March last, from which the following are extracts:—

"From these numerous observations, one hundred and twenty in number, together with many others which have not been tabulated, I am quite convinced that the scammony prepared by the new process from the untapped root is quite equal, as a remedy, to the very best virgin scammony which is met with in commerce, and equal, in fact, to the resin which is extracted from commercial scammony by means of ether; and it possesses this most important advantage over the scammony of commerce, namely, of being entirely free from the frauds which are almost constantly practised upon it in the country where the plant grows, and in which it has hitherto been collected, and, therefore, being perfectly uniform in its physical characters, composition and therapeutic action. There can, therefore, be no objection, but, on the other hand, manifest advantage, in employing it in place of the scammony commonly met with.

"A. B. GARROD, M.D., F.R.S., F.R.C.P.
"Professor of Materia Medica, Therapeutics and Clinical Medicine at University College; Physician to University College Hospital."

"I have endeavoured to ascertain the relative activity of Messrs. M.'s scammony, and of a fine specimen of commercial virgin scammony, by prescribing these drugs alternately in equal doses to the same patient. The results, according to the judgment of myself and others who have assisted me in watching the cases, is that in most instances Messrs. M.'s scammony has proved itself decidedly more active than the virgin scammony. As to pleasantness of operation, or the reverse, there seemed to be no choice between the two specimens.

"That a preparation of scammony should be a little more or a little less active is of comparatively small importance. It is far more important that the drug should have a fixed and uniform composition and activity, so that the prescriber may know, with an approach to certainty, what doses are required to produce a given effect. This advantage of uniform activity Messrs. M.'s Scammony seems likely to possess over the scammony which has hitherto been in common use, and which is a drug notoriously of most uncertain composition and power.

"GEORGE JOHNSON, M.D., F.R.C.P.
"Professor of Materia Medica and Therapeutics in King's College; Physician to King's College Hospital."

Blancard's Pills of Unchangeable

IODIDE OF IRON.

Recommended by the Academy of Medicine of Paris, and authorised by the Medical Council of St. Petersburg. Extensively tried in the Hospitals of France, Belgium, Ireland, Turkey, &c. Favourably noticed at the Universal Exhibition of New York, 1853, and Paris, 1855.

"Of all the modes hitherto proposed of administering iodide of iron in the pure state, I think Mr. Blancard's the best."—Chemistry applied to Therapeutics, by M. Mialhe, Deputy-Professor to the Faculty of Medicine of Paris, Pharmacien to the Emperor, 1856, p. 219.

These Pills stand now very high in the therapeutics of every country, as may be seen by the above quotations, and also by the numerous scientific articles in medical periodicals and works (a).

Being enveloped in a very thin resino-balsamic coating, they present the great advantage of not being liable to any deterioration, of having no taste, of being small, and not distressing the stomach. As they possess the properties both of iodine and iron, they are especially beneficial in chlorotic, scrofulous, tubercular, or cancerous affections, as also in leucorrhœa, amenorrhœa, anæmia, &c. &c., and they furnish the medical man with an excellent means of modifying lymphatic, feeble, and debilitated constitutions. Dose, 2 to 4 pills a day.

N.B.—Impure or altered Iodide of Iron is an unsafe remedy, and may even prove dangerous. Only such bottles as bear an electro-plated seal fixed to the lower part of the cork, and the signature of the inventor placed on a green label, are to be considered as prepared by Mr. Blancard. The public should beware of spurious imitations.

To be had at M. BLANCARD'S, Pharmacien, Rue Bonaparte, No. 40 Paris. General dépôt in England at M. Gabriel Jozan's, French chemist 49, Haymarket, London. In Ireland, at Mr. Vitties, Stevens's Hospital Dublin. In the United States, at E. and S. Fougere, Chemists, 30, North William-street, New York. To be obtained retail from the principal Chemists.

(a) Bulletin de l'Académie de Med 1850, page 1015; Gazette Médicale, Aug. 17, 1850; Union Médicale, Aug. 15 and 22, 1850; Gazette des Hôpitaux, March 15, 1853, and June 10, 1854; Gazette Hebdomadaire de Médecine et de Chirurgie, Aug. 31, 1855; Revue de Thérapeutique Médico-Chirurgicale, Feb. 15, 1855; Abeille Médicale, Revue Clinique; Répertoire de Chimie et de Pharmacie; Annuaire de Thérapeutique pour 1851, page 199; Orfila, Elements of Chemistry; Mialhe, Chemistry applied to Therapeutics, 1856, p. 319; Quevenne, Essay on the Physiological and Therapeutic Action of Preparations of Steel, page 97, 1854; Bricheau, Treatise on Chronic Diseases seated in the Respiratory Organs; Soubeiran, Treatise on Pharmacy; Dorvault, Officine, &c. &c.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

An Opportunity which may not again occur for years.—A GENERAL PRACTICE of £750 per annum, situate in a home county, and perfectly unopposed, is offered for £500 cash to a member of the Established Church. A thorough and careful personal introduction to the whole of the patients. The entire profits will belong to a purchaser from the 1st of January next. Medical and Surgical diplomas essential to success.

Apply to Messrs. LARA and WALTERS, 6, Pump-court, Temple, E.C.

Royal College of Surgeons of ENGLAND.

Notice is hereby given, That the Primary or Anatomical Examination for the Diploma of Member of this College will be held on TUESDAY, the 24th of January next, and following days. And that the Surgical or Pass Examination for the Diploma of Member will be held on TUESDAY the 31st of January and subsequent days. Particulars relating to these Examinations, may be obtained on application at the College.

EDMUND BELFOUR, Secretary.

December 6th, 1859.

Royal Westminster Ophthalmic HOSPITAL, KING-WILLIAM STREET, CHARING-CROSS.

A COURSE of LECTURES will be delivered at this HOSPITAL, upon the Anatomy, Physiology, Surgery and Diseases of the EYE, in accordance with the Regulations of the Army and East India Boards, by HENRY HANCOCK, Esq., and HENRY POWER, Esq. The Use of the Ophthalmoscope, and the Microscopical Anatomy of the Eye, by JABEZ HOGG, Esq. To COMMENCE on 5th December, 1859, at 12.30. Fee for the Course, including Three Months' Hospital Practice, £5 5s.

South Staffordshire General Hospital.

A SPECIAL GENERAL BOARD of GOVERNORS of this Charity will be held on TUESDAY the 3rd day of January next, at ELEVEN o'clock precisely, for the purpose of ELECTING a SURGEON to fill the vacancy occasioned by the death of the late Richard Sandford Esq. Candidates, who must be Fellows or Members of the Royal College of Surgeons in London, Edinburgh, or Dublin, are requested to send in their Testimonials and Qualifications under cover to the Secretary, on or before Saturday the 24th day of December next.

By Order of the Weekly Board,
BENJAMIN SMITH, Secretary.

Wolverhampton, 29th November, 1859.

Operative Surgery.—Army Medical

BOARD.—The new Regulations of the Army Medical Department, requiring that every Candidate for a Commission "must produce a Certificate of Attendance upon a Course of Operative Surgery, given separate and distinct from that of general Surgery, in addition to a Certificate of having himself performed all the great operations on the dead body." Mr. SPENCER WELLS will commence a Course of LECTURES and DEMONSTRATIONS (in compliance with these Regulations), at the GROSVENOR-PLACE SCHOOL of MEDICINE, immediately after the Christmas Vacation. For particulars, apply to Dr. Richardson, Hon. Secretary, 12, Hinde-street, W.

Stamford, Rutland, and General

INFIRMARY. The Governors will proceed to the ELECTION of a HOUSE-SURGEON, APOTHECARY, and SECRETARY, at the TOWN-HALL, on TUESDAY, the 10th January, 1860, at One o'clock p.m. Candidates, who must be Members of the Royal College of Surgeons, and Licentiates of Apothecaries' Hall, are requested to send in Testimonials of Medical Education and Moral Character, addressed to the Chairman of the Weekly Board, on or before December the 27th, 1859. Salary, £100 per annum, with Board, Lodging, and Washing. The Secretary will furnish any information that may be required.

Board-room, November 29th, 1859.

To Invalids.—A Married Medical

MAN, without family, wishes to receive into his house, an Invalid Lady, who will have her own rooms and servant. The house, which is large, is healthily situate in a town within a short distance of London by rail, and the surrounding country is beautiful. References to Physicians, Clergymen, and others. For further particulars, address to A. B., 21, Harp-lane, London, E.C.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Royal Medical Benevolent College

BUILDING FUND.—Ladies who are willing to aid the funds of the College, and also desirous to obtain the privilege of voting at all Elections of Pensioners and Foundation Scholars, are respectfully reminded that Saturday, the 31st of this month will be the last day on which Five Guinea Donations can be received as the qualification for Life Governorship, under the special resolution "That, with the view of completing the College, ladies be admitted as Life Governors on payment of Five Guineas by the 31st of December." Donations will be thankfully received until that day, by the Treasurer,
JOHN PROPERT.

6, New Cavendish-street, London, W. 12th Dec., 1859.

Medical Registration Office.

32, SOHO-SQUARE, LONDON, W.

NOTICE.—The Copy of the MEDICAL REGISTER, to be printed and published in 1860, as directed by the 27th Section of the Act—which contain those Names only which appear on the General Register, as existing on the 1st day of January, 1860.

November 21, 1859.

Wanted, by a Medical Practitioner

in a Provincial Town, fifty miles from London, a QUALIFIED ASSISTANT, to Visit and do part of the Dispensing. A light weight, and accustomed to horse-back indispensable. Apply to Warner and Barclay, 55, Fore-street, Finsbury.

Bristol General Hospital.—The Office

of HOUSE-SURGEON to this Institution is now vacant by the resignation of Mr. F. Poole Lansdown. Application to be made by letter, addressed to the Committee at the Hospital (enclosing testimonials of character and ability), on or before MONDAY the 2nd of January next.

By Order of the Committee,

December 13, 1859.

By Section 8, Rule 1, it is provided:—"That no person be eligible to this office unless he exhibit to the Committee satisfactory proof that he is a Member of the College of Surgeons of London, Edinburgh, Glasgow, or Dublin, and also a Licentiate of the Apothecaries' Company in London or Dublin; nor be appointed for any term less than three years, in case the Committee shall so long require his services."

R. S. UNDERWOOD, Secretary.

Ringwood Union, Hants.—Wanted,

A MEDICAL OFFICER for District No. 1. The Salary (exclusive of 10s. for Midwifery Cases in the town, and 15s. one mile beyond Ringwood Church, and Fees for Surgical Cases) is £55 per annum. The district comprises a population of 3543, and an area of about 574 acres. The usual conditions and engagements as to Medicines, Returns, and Attendances, &c., will be inserted in the contract. The successful Candidate will be appointed Vaccinator for the same district. The ELECTION is fixed for MONDAY, the 2nd day of January, 1860, at Two o'clock, p.m. Written applications, with testimonials, must be left with, or addressed to, the Clerk, so as to be received before 12 o'clock on Saturday, the 24th day of December instant.

Ringwood, December, 1859.

HENRY ST. JOHN NEALE, Clerk.

Edwin Cottingham, Deceased.—

Pursuant to the Act of Parliament of the 22nd and 23rd Vict., cap. xxxv., entitled "An Act to further amend the Law of Property, and to Relieve Trustees," all Creditors and other persons having claims against the estate of Edwin Cottingham, late of Bexley, in the county of Kent, Surgeon, deceased, who died at Bexley aforesaid, on the 28th day of November, 1858, are hereby required to send in their claims to James Thomas Cookney, of No. 11, Bolton-row, Piccadilly, London, gentleman, the executor of the deceased; or to us, as his Solicitors, at our Chambers, No. 17, Lincoln's-inn-fields, in the county of Middlesex, on or before the 16th day of February, 1860; at the expiration of which time the Executor will proceed to distribute the assets of the said Edwin Cottingham among the parties entitled thereto, having regard only to the claims of which the Executor shall then have had notice, and will not be liable for the Assets so distributed to any person of whose claim he shall not have had notice at the time of such distribution. Dated this 14th day of December, 1859.

MASON and WITHALL,

Solicitors to the Executor.

London: Printed by CHARLES REED and BENJAMIN PARDON, of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and Published by JOHN CHURCHILL, at the Publishing Office, No. 17, New Burlington-street, in the Parish of St. James, in the City of Westminster.—December 17, 1859.

Lectures on the Development of the GRAVID UTERUS. By WILLIAM O. PRIESTLEY, M.D., Fellow of the Royal College of Physicians, Edinburgh, Physician-Accoucheur to the St. Marylebone Infirmary.
John Churchill, New Burlington-street.

On the Injurious Effects of Mercury
in the TREATMENT of DISEASE. By S. O. HABERSHON, M.D. Lond., Fellow of the Royal College of Physicians; Senior Assistant Physician and Lecturer on Materia Medica at Guy's Hospital.
John Churchill, New Burlington-street.

Just published, Fourth Edition, with engravings, considerably enlarged, 8vo, cloth, 7s. 6d.

Stricture of the Urethra, its Complications and EFFECTS; a Practical Treatise on the Nature and Treatment of these Affections. By ROBERT WADE, F.R.C.S., Senior Surgeon to the Westminster Dispensary.
John Churchill, New Burlington-street.

Just published, Third Edition, Revised and Enlarged, post 8vo, cloth, 9s.
A Practical Treatise on Diseases of the HEART, LUNGS, and AIR-PASSAGES, with a Review of the Several Climates recommended in these affections. By JAMES BRIGHT, M.D., F.G.S., Member of the Royal College of Physicians, London.
John Churchill, New Burlington-street; Hatchard and Co., 187, Piccadilly.

Just published, price 6d. cloth, postage 4d.
Meade's Manual for Examination at APOTHECARIES' HALL, or other MEDICAL INSTITUTIONS. Third Edition, much improved, and corrected to the present time. Or sold separately—
Part 1, for the First Examination, price 4s., postage 2d.
Part 2, for the Second Examination, price 2s. 6d., postage 1d.
London: Henry Renshaw, 356, Strand.

VOL. XL. No. 1056.—NEW SERIES, No. 495.

CHRISTMAS PRESENT.
201 Plates, £5 5s. plain, £8 8s. coloured,
Quain and Wilson's Anatomical PLATES. Two vols. royal folio, half-bound morocco. Or in five divisions, cloth (sold separately).
Muscles, 51 plates, cloth, £1 5s. plain, £2 4s. coloured.
Vessels, 50 plates, cloth, £1 5s. plain, £2 coloured.
Nerves, 38 plates, cloth, £1 1s. plain, £1 14s. coloured.
Viscera, 32 plates, cloth, 17s. plain, £1 10s. coloured.
Bones and Ligaments, 30 plates, cloth, 17s. plain, £1 coloured.
London: Walton and Maberly, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row.

One Vol. 8vo, cloth lettered, price 8s. 6d.,
On the Constitutional Treatment of FEMALE DISEASES. By EDWARD RIGBY, M.D., etc.
"We know of no other obstetric writer who so strongly insists on the intimate connexion between uterine and constitutional disorders, or who has carried out this principle so consistently and so successfully. On this account we look upon the work as peculiarly valuable, and calculated to do an immensity of good at the present time, by dispelling the one-sided and narrow views so generally prevalent respecting this class of diseases, and placing their pathology and treatment on a sounder and more rational basis."—Dublin Quarterly Journal of Medical Science.
London: Henry Renshaw, 356, Strand.

DR. G. OWEN REES ON URINARY DISEASES.
Lately published, in 8vo, price 5s.
On Calculous Disease and its CONSEQUENCES: Being Croonian Lectures Delivered before the Royal College of Physicians. By GEORGE OWEN REES, M.D., F.R.S., Physician to, and Lecturer on Medicine at, Guy's Hospital.
London: Longman, Brown, and Co., Paternoster-row.

Just published, 8vo, cloth, price 3s. 6d.
Essays in Medical Science.
I. On the Nature of Inflammation.
II. On the Encephalic Circulation, and its Relation to the Physiology of the Brain.
By JAMES CAPPIE, M.D., Edinburgh.
Sutherland and Knox, Edinburgh. Simpkin, Marshall, and Co., London.

A Perusal of all the New Books
as soon as published, for
ONE GUINEA PER ANNUM.

LEWIS'S MEDICAL LIBRARY, 15, GOWER STREET NORTH.
Books may be retained as long, or exchanged as frequently, as suits the convenience of Subscribers. Prospectus, gratis, on application.
Medical Book Clubs supplied on the following terms:—
Two Guineas per annum. . . . Four Volumes at a time.
Three Guineas per annum. . . . Seven Volumes at a time.
Five Guineas per annum. . . . Fourteen Volumes at a time.
Ten Guineas per annum. . . . Thirty Volumes at a time.

WORKS ON CHEMISTRY.

Fownes' Manual of Chemistry.

Edited by H. BENICE JONES, M.D., F.R.S., and A. W. HOFMANN, Ph.D., F.R.S. Seventh Edition, fcap. 8vo, cloth, 12s. 6d.

The Use of the Blowpipe. By

Professors PLATTNER and MUSPRATT. Third Edition, 8vo, cloth, 10s. 6d.

The First Step in Chemistry. By

ROBERT GALLOWAY. Second Edition, fcap. 8vo, cloth, 5s.

By the same Author,

Manual of Qualitative Analysis.

Second Edition, post 8vo, cloth, 4s. 6d.

Chemistry, as Exemplifying the

WISDOM and BENEFICENCE of GOD. By GEORGE FOWNES, F.R.S. Second Edition, fcap. 8vo, cloth, 4s. 6d.

Practical Chemistry, including Ana-

LYSIS. With numerous Illustrations on Wood. By JOHN E. BOWMAN, Professor of Practical Chemistry in King's College, London. Third Edition, fcap. 8vo, cloth, 6s. 6d.

By the same Author,

Medical Chemistry. With Illustrations

on WOOD. Third Edition, fcap. 8vo, cloth, 6s. 6d.

Handbook of Chemistry, Theoretical,

PRACTICAL, and TECHNICAL. By F. A. ABEL, F.C.S., Chemist to the Board of Ordnance; and C. L. BLOXAM, Demonstrator of Practical Chemistry in King's College. Second Edition, 8vo, cloth, 15s.

Instruction in Chemical Analysis.

By C. REMIGIUS FRESENIUS. Edited by LLOYD BULLOCK.

QUALITATIVE. Fifth Edition, 8vo, cloth, 9s.

QUANTITATIVE. Second Edition, 8vo, cloth, 15s.

A Manual of Photographic Che-

MISTRY, including the PRACTICE of the COLLODION PROCESS. By T. FREDERICK HARDWICH, late Demonstrator of Chemistry, King's College, London. Fifth Edition. Fcap. 8vo, cloth, 7s. 6d.

Chemistry of the Four Seasons.

SPRING, SUMMER, AUTUMN, WINTER. Illustrated with Engravings on Wood. By THOMAS GRIFFITHS. Second Edition, foolscap 8vo, cloth, 7s. 6d.

John Churchill, New Burlington-street.

DR. STEGGALL.

STUDENTS' BOOKS FOR EXAMINATION.

A Manual for Apothecaries' Hall

and other MEDICAL BOARDS. Twelfth Edition, 12mo, cloth, 10s.

A MANUAL FOR THE COLLEGE OF SURGEONS; Intended for the Use of Candidates for Examination, and Practitioners. Second Edition, 12mo, cloth, 10s.

GREGORY'S CONSPECTUS MEDICINÆ THEORETICÆ. The First Part, containing the Original Text, with an Ordo Verborum, and Literal Translation. 12mo, cloth, 10s.

THE FIRST FOUR BOOKS OF CELSUS; containing the Text, Ordo Verborum, and Translation. Second Edition, 12mo, cloth, 8s.

A TEXT-BOOK OF MATERIA MEDICA AND THERAPEUTICS. 12mo, cloth, 7s.

FIRST LINES FOR CHEMISTS AND DRUGGISTS PREPARING for EXAMINATION at the PHARMACEUTICAL SOCIETY. Second Edition, 24mo, cloth, 3s. 6d.

DR. LITTLE ON DEFORMITIES.

In 8vo, with 160 Engravings and Diagrams, 15s. cloth,

On the Nature and Treatment of

CONTRACTIONS and DEFORMITIES. By W. J. LITTLE, M.D. Senior Physician to the London Hospital, Founder of the Royal Orthopædic Hospital, &c.

1. Deformities in general. Treatment Operative, Instrumental, and Physiological. Forcible Extension under Chloroform.
2. Contractions from Wounds and Diseases of Joints, Accidents, Rheumatism, &c.
3. Contractions from Spasm, Paralysis, Burns, Habitual Retention in one Position.
4. Deformities from Rickets, Weakness, and Curvatures of Bones.
5. Congenital Distortions and Dislocations, Club-foot, Club-hand, &c.
6. Congenital Malformations, Monstrosities.
7. Distortions of the Spine, from Strumous Disease, Rickets, Lateral Curvature, Spasm, and Paralysis.

Appendix : On Relapsed and Neglected Cases. Index.

"The best treatise on the subject in any language."—The Lancet, the British and Foreign Medico-Chirurgical Review, and the Philadelphia Medical Examiner.

ON CLUB-FOOT and ANALOGOUS DISTORTIONS, including their Treatment both with and without Surgical Operation. 8vo. Forty-one Engravings. 12s.

ON ANCHYLOSIS or STIFF JOINT: a Practical Treatise on the Contractions and Deformities resulting from Diseases of the Joints. 8vo. Thirty-two Engravings. 7s. 6d.

London : Longman, Brown, Green, and Longmans.

Now ready, Vol. XLII., in 8vo, pp. 514, with 9 Plates (5 coloured),

1 Woodcut, and 14 Diagrams, price 16s. cloth, gilt top,

Medico - Chirurgical Transactions

published by the Royal Medical and Chirurgical Society of London. Vol. XLII. ; Second Series, Vol. XXIV.

London : Longman, Green, Longman, and Roberts.

Now ready, Crown 8vo, cloth, price 5s.

A Fallen Faith : being the Psychology

of QUAKERISM. By EDGAR SHEPPARD, M.D., L.R.C.P. Lond., F.R.C.S. Eng.

London : Piper, Stephenson, and Spence, Paternoster-row.

DR. KIDD ON CHLOROFORM, Third Edition, Revised,

Manual of Anæsthetics. By

CHARLES KIDD, M.D.

"* From a large number of unsolicited Testimonials as to the value of this work, the publisher is permitted to print the following from Mr. WILLIAM CROOKES) will contain Verbatim Reports of these Lectures, copiously illustrated with Engravings. Price Threepence Weekly. Order of any Bookseller or News-agent.

London : Henry Renshaw, 356, Strand.

ORIGINAL LECTURES.

ON CEREBRAL SYMPTOMS
INDEPENDENT OF CEREBRAL DISEASE.

DELIVERED AT THE
Hospital for Sick Children,
DEC. 3, 1859,

By CHARLES WEST, M.D.
Physician to the Hospital for Sick Children.

IMPORTANCE OF THE SUBJECT, AND DIFFICULTIES WHICH ATTEND IT.—THREE CLASSES OF CASES IN WHICH THE BRAIN MAY BE DISTURBED WITHOUT DISEASE: IN FEVERS, IN INFLAMMATION OF THE THORACIC VISCERA, IN VARIOUS DISORDERS OF THE DIGESTIVE ORGANS.—RULES FOR DISCRIMINATING IN EACH BETWEEN THE SIGNS OF SYMPATHETIC DISORDERS OF THE BRAIN, AND THE SYMPTOMS OF ITS REAL DISEASE.

(Cases of Chronic Ailments Simulating Cerebral Disease reserved for Future Examination.)

GENTLEMEN,—Of all the inquiries which, in private practice, the parents of a sick child will put to you, there is none that will be made so often or so eagerly as this,—“Do you think his brain is affected?” The answer which you give to this question will at once convey a sense of unspeakable relief, or will produce a feeling of blank hopelessness; either, perhaps, excessive, but either most natural. Without doubt the importance of a correct reply is very great, for your prognosis and your line of treatment are dependent on it, and an error, even though corrected in twenty-four hours, may be irreparable. I think, then, that the time will not be misspent which we devote to-day to an examination of the different circumstances wherein we are most likely to meet with the Symptoms of Cerebral Disorder independent of real Cerebral Disease. Now you may encounter such symptoms in two different conditions: either in the course of acute affections simulating active disease of the brain, or in the course of chronic ailments, where there may seem to be reason for apprehending the advance of slow disorganisation; and each class of cases demands a separate consideration.

Before examining either class of cases in detail, I would, however, remind you that in the child, as in the adult, the brain is disturbed more or less in the course of every acute affection of the general system; and further that in proportion to the youth of the child there will be an apparent sameness in the characters of such disturbance, and a consequently increased difficulty in determining the cause whereon it depends. Thus, for instance, whether one of the exanthemata is about to come on, or influenza, or inflammation of the lungs; or whether the illness is a mere febrile attack consequent on dentition, there will in all these circumstances alike be a hot skin, and a frequent pulse, a loss of cheerfulness, a heavy head, a disposition to drowsiness, and yet a state of unrest; symptoms, in short, which are just the same with those that in the infant would attend the early stage of actual disease of the brain.

But while I refer to this fact as one never to be lost sight of in the endeavour to discover the true import of the cerebral disturbance which accompanies almost every form of acute illness in early life, my special object to-day is to point out to you some of the circumstances wherein, in infancy or early childhood, a correct diagnosis is peculiarly difficult.

I propose to notice very briefly—

1st. The cerebral symptoms that usher in the attack, or accompany the early stages of fevers.

2nd. Those which at the onset of acute inflammations of the thoracic viscera, sometimes throw the evidences of the real disease into the shade; and,

3rd. Those dependent on some disorder of the abdominal viscera, which though not always itself of an acute character, yet gives rise to sudden disturbance of the nervous system, and to symptoms that simulate active cerebral disease. Such are sometimes the consequences of unsuitable food, of diarrhoea, of colic, and of intestinal worms.

Afterwards, if time allows, I purpose

VOL. XL. No. 1056.—NEW SERIES, No. 495.

4th. To make a few observations on the more chronic ailments, in which cerebral symptoms are likely to be observed, and their import is apt to be misapprehended.

Now with reference to cases of the first class; namely, to those in which cerebral symptoms usher in the attack, or accompany the early stage of fevers, I may observe, and the remark holds good in other cases also, that in proportion to the suddenness of the onset, and the violence of the character of such symptoms, is the probability of their depending on real disease of the brain so much the smaller. A severe attack of convulsions is rarely an early symptom,—is almost never the first symptom of real acute disease of the brain. Its occurrence, therefore, always raises a presumption that its cause is to be sought in some source of irritation external to that organ; that, how much soever the immediate urgency of the case may require remedies addressed to the brain, the ultimate dangers of the disease will be found to depend on some other cause, to arise from mischief seated elsewhere than in that part which at first seemed to be the most suffering.

The early stage of the eruptive fevers sometimes affords a very remarkable illustration of the amount of disorder of the nervous system, which may precede or accompany the full outbreak of the rash. During the first day of the eruption of measles, for instance, one or two attacks of convulsion sometimes occur, though they usually pass away without being followed by protracted coma, or by any abiding signs of cerebral disorder. In these cases the previous existence of the morbillous catarrh, often even the presence of faintly-marked stigmata of the rash, the general heat of skin more intense upon the trunk than even about the head, will usually preserve from error, and you may speak with confidence as to the probably speedy disappearance of the cerebral symptoms. Far more serious, however, are the signs of cerebral disturbance by which small-pox and scarlatina are occasionally ushered in; the transition from apparent health to violent convulsions being sudden, and apparently causeless, the fits themselves most formidable, and the coma by which they are succeeded very profound. Such was the case of a little girl, two years old, who until the day before that on which I saw her had never had an hour's illness. She had eaten a hearty dinner, and though she vomited soon afterwards did not seem otherwise indisposed, and slept well in the night. Immediately on waking in the morning, however, she had a fit, during which she was insensible, much convulsed; and insensibility, with occasional convulsions, and great heat of skin, continued for the ensuing twenty-four hours. Depletion, both general and local, the latter twice repeated, was followed, at the end of twelve hours more, by considerable diminution of the convulsive movements; and forty hours after the first fit the child fell asleep, and dozed quietly for a few hours. She awoke sensible, and continued so. On my visit in the morning I found her quiet and sensible, without any sign of convulsion; her face was very pale; her head, before so hot, was now quite cool; her pulse had sunk in frequency, and had lost its fulness. An eruption of a papular character had appeared on the hands, arms, inside of the thighs, and slightly on the face. This eruption was the small-pox, and the disease ran its course without an unfavourable symptom.

The comparative rarity of small-pox may be some excuse for my not having been prepared for the possibility of the convulsions depending in this case on the cause to which they were really due; but it is well to bear in mind that in every instance where cerebral symptoms come on without obvious reason in early life, enquiry should be made as to the date of previous vaccination, and the arm should be examined for its evidence in the cicatrices left by its performance. A similarly stormy onset, however, is sometimes observed in cases of scarlet fever; and then it usually preludes an attack of a malignant kind, characterised by speedy loss of power and tending to an early death. This occurrence, indeed, never very common, is most rare when scarlet fever is merely sporadic, but in epidemics of the disease it happens more frequently, and this even although the general characters of the disease are of a mild—not at all of a malignant—type.

“In the autumn of 1831, and during the early part of 1832,” says Dr. Von Ammon (a), “scarlatina prevailed epidemically at Dresden. The cases which at first presented themselves to my

(a) Beschreibung eines Scharlach-epidemiens zu Dresden, in *Analekten für Kinderkr.* Vol. III. Heft 11, p. 43.

notice were, for the most part, mild in character, and ran a favourable course; but, at the same time, I met with some instances where death took place very rapidly and under peculiar symptoms of cerebral disturbance in children who neither during life nor after death, showed the slightest trace of scarlatinoid eruption. At first I felt in doubt as to the cause and nature of the rapidly fatal head affections; for I did not any how connect them with scarlet fever, while the disease differed from inflammation of the brain in the extreme rapidity of its onset, in the fact that notwithstanding the intensity of the head-ache it was unaccompanied either by nausea or vomiting, that the bowels were not constipated, and that the pulse beat with such frequency that it was almost impossible to count it, while the attitude of the patient was not at all such as is usually assumed by any one suffering from acute cerebral inflammation."

Dr. Von Ammon then goes on to say how a post-mortem examination of one of these cases led him to the suspicion which afterwards became a certainty in his mind, that these were really instances of scarlatina; that the impression of the poisoned blood upon the brain and spinal cord destroyed life before time had elapsed sufficient to allow of the ordinary manifestations of the disease. The possibility that the clue to the understanding of symptoms of formidable cerebral disorder is to be found in the approach of one of the eruptive fevers, enforces the necessity for learning in every case the history of a child's previous ailments, and renders it even more imperatively your duty to do so at a time when scarlatina is epidemically prevalent. Rapid too as is sometimes the advance of inflammation of the brain, its progress is commonly far slower than that of the cerebral symptoms which accompany the onset of the fever, while almost invariably some characteristic or other of the mere local inflammation would be absent, some anomaly would show itself such as excited the suspicion of the German physician, and ought to awaken yours.

But besides the instances just referred to, in which the temporary violence of the cerebral symptoms suggests the idea that active inflammation of the brain is present, there are others of less rarity where, though the feeling of anxiety as to the real nature of the disease is less urgent, it is yet of longer duration. Such are the cases in which, during the early stage of typhoid fever, the symptoms of cerebral disturbance so preponderate that for some days a doubt may be entertained as to whether the fever is sympathetic with disease of the brain, or the brain is disordered as a consequence of the fever. The question in short is between tubercular hydrocephalus and typhoid fever. Now something may be gathered from the age of the child, at least towards raising a presumption one way or the other, for the older the child is, the more likely is the disorder to be typhoid fever, the younger it is the more likely to be hydrocephalus; and I strongly recommend you in doubtful cases to put the issue between these two definite diseases, and not to indulge your indolence and put to sleep doubts which you feel unable to solve by talking to yourself or to your patient's friends of gastric fever, worm fever, and so on,—terms to which no definite import is attached either by yourselves or by others. There is not time to pass in review minutely all the diagnostic symptoms which mark typhoid fever and serve, in spite even of much cerebral disturbance, to distinguish it from hydrocephalus. It may, however, suffice to remind you that vomiting is generally absent, is never obstinate, nor succeeded by long-continued nausea; that the bowels are often relaxed; never obstinately constipated, and that the evacuations are light-coloured, fecal, but usually watery. Further, the abdomen is full, usually tender, and flatus is always to be felt in the intestines; the tongue is not often much coated, it is red at the tip and edges, and early shows a tendency to become dry. The skin is very hot, the heat is pungent, the pulse is frequent, and continues so throughout, but is never irregular nor intermittent. Even the very cerebral symptoms have their characteristic features; for the early occurrence of delirium, which is so general in typhoid fever, is another point wherein it differs from hydrocephalus, in which much pain of the head, much drowsiness, a marked change of temper and disposition, yet coexist with a perfect intelligence.

"Surely," you may say, "these differences are marked enough; to dwell on them is superfluous, nay, wearisome:

the help we want is in real diagnostic difficulties, not in cases so obvious, whose right interpretation is so easy."

Believe me, gentlemen, nine-tenths of the errors of diagnosis are made in easy cases, in cases whose features are sufficiently marked for recognition, if the observation had been trained to notice them, or the mind been disciplined to the inquiry in every instance: Why do I believe the disease to be this, why not that, or the other? The power of intuition and the habit of guessing are two very different things, though sometimes mistaken for each other. The former is now and then the reward of years of patient observation; humility and diligence are its parents. The latter is engendered between indolence and self-conceit; he who takes up with it, whatever be his abilities, forfeits all chance of ever attaining the other; he adds not to his knowledge from being right, he gathers no lesson from being wrong; for him experience yields no fruit, age brings to him no wisdom."

There is a second class of cases in which the predominance of symptoms of cerebral disturbance sometimes masks the real nature of the disease, and such cases are met with among the acute inflammations of the thoracic viscera. Risk of being led astray would indeed be almost entirely avoided if you made it an invariable rule in all the acute ailments of early life to regard your examination as incomplete until after you had made a careful auscultation. The symptoms of disturbance of respiration are indeed often too marked to be overlooked; the cough, the pain in the chest, and the hurried breathing render mistake impossible; but it now and then happens at the commencement of pleurisy, and in pneumonia, especially of the upper lobes, that the nervous system sympathises so deeply as to draw away the attention from those symptoms which, though obvious enough to him who seeks for them, do not stand out so prominently as to attract the first hasty glance. Pneumonia and pleurisy, especially the latter, occasionally set in with a convulsion; but you will, I trust, remember the caution which I have already given as to the sudden violence of cerebral symptoms, indicating that the brain is disturbed by some eccentric cause rather than by mischief seated in that organ itself. Pleurisy, more particularly when affecting the right side, is sometimes ushered in by vomiting, and this vomiting seems all the more suspicious if it has just preceded or just followed, an attack of convulsions. It is accompanied by fever and by intense headache; the child cries aloud or screams much in its sleep, and if it is old enough for the symptom to be observed, delirium is not unlikely to be present. The cough may be but slight, or altogether absent, and even the pain not considerable, and it is then quite possible that the disturbed breathing may be put down to that sympathetic disorder of respiration, to which the name of "cerebral breathing" has been applied. Need I say that it is much harder to correct a diagnostic error into which one has fallen than by care to avoid it in the first instance. If the case is one of pneumonia affecting the upper lobes, severe headache, drowsiness, great heat of head, though found, if carefully observed, not to be greater than of the surface elsewhere, all serve to mislead. Delirium, too, is very often present if the child is old enough for that symptom to manifest itself; and the mind of the attendant fluctuates in such cases between the ideas of cerebral congestion, of hydrocephalus and of typhoid fever; one impression preponderating at one part of the day, another at a different one; but the true view of the case not presenting itself to the mind at all. In the case of pleurisy, even though the mistake is discovered late, the child will probably survive, and the distended side, the adaptation of posture, the subsidence of the fever, and the disappearance of the head symptoms are tolerably sure to put the doctor, though tardily on the right track. In pneumonia the error is even more serious, for the disease is more formidable, and the longer continuance of cerebral disturbance is likely to keep up the mistake. In its later stages, too, the convulsion and the coma which sometimes come on as the results of the imperfect depuration of the blood, perpetuate the misapprehension, which, perhaps, a post-mortem examination alone brings to light.

Now, without going into minute detail, for which there is no leisure, I may observe that in these cases you will find something always wanting of those symptoms which characterise real cerebral disease. Perhaps there has been a convulsion; but it was not followed by coma, nor by paralysis of either side. Vomiting has occurred, but it has soon subsided. The head is hot, but yet not hotter than the rest of the

surface, and it is unaccompanied by violent pulsation of the carotids. The light may be unpleasant, but it is not shunned with that intense sensitiveness to its presence which closes the eyelids even in the darkened chamber. Again, though the breathing is sometimes hurried in cases of cerebral disease, yet here the hurry is constant; if the case is one of pneumonia it is extreme, and between the hurried breathing and the rapid pulse a constant proportion is observed, while, though the cough may be but slight, some cough is almost surely present. Such, and such-like, are the criterions by which, if you test the symptoms in these doubtful cases, you will run but small risk of not coming to a right conclusion.

Nearly forty years ago a French Physician (b) wrote an essay, the object of which was to illustrate what he termed the predominance of the digestive organs over the brain in childhood, and he appended to it the details of forty-eight cases in corroboration of his opinions. Now, although like all other books written to develop one idea, this is somewhat one-sided in its views, and, perhaps, a little overcharged in its statements, yet the main point is correct—namely, that

The third class of cases in which symptoms of cerebral disease are provoked by disorders of the digestive organs is very numerous and very important.

A slight acquaintance even with the practice of Medicine will have familiarised you with various symptoms of disturbance of the nervous system which derangements of the digestive organs and their appendages bring with them. Such are the unquiet sleep, the night-terrors, the grinding of the teeth, the sleeping with half-closed eyelids, the thumbs drawn more or less into the palm, which one often observes in infancy and early childhood, and some of which are seldom altogether absent during dentition, or when changes are first made in the diet of infants. But there are besides two distinct classes of symptoms to which disorders of the digestive organs, when severe, may give occasion—namely, convulsions on the one hand, and on the other, that form of cerebral disturbance characterised by mingled exhaustion and irritation, to which the name of the hydrocephaloid disease, or spurious hydrocephalus, has been given.

Convulsions from this cause are generally the result of unsuitable food, or of an over-full meal in infancy or early childhood; though other sources of irritation, as that of worms, or even of a calculus in the kidney, may produce them. Those which depend on indigestible food, are sometimes so severe as to threaten life, or even actually to destroy it. They nearly proved fatal in the case of a little boy, five years old, previously healthy, who on July 9, 1846, dined off some boiled salmon, of which the rest of the family partook more heartily than he, without any ill effects. At ten o'clock on the following morning, having slept well during the night, he was suddenly seized by a violent convulsion, in which his whole surface became exceedingly livid, and his lips of a deep purple hue. His respiration was greatly affected, he seemed as if he could not get air enough into his chest to keep him alive, and he appeared every moment as if he would be suffocated; while his pulse was feeble and frequent, and the temperature of his body low. Under the influence of the cold douche to his head, his breathing became less laborious, his lips regained much of their natural florid colour, the convulsions greatly diminished, and the child began to make some half-conscious movements. It was now possible to give him an emetic, which caused free vomiting twice, and the rejection of some of the undigested salmon. The child was next placed in a hot mustard bath; while in it the convulsions completely ceased, after having lasted three hours and a-half. He was now put in bed, where he slept quietly for four hours, and awoke quite well.

Now that which took place here you may observe not very rarely, and with symptoms of equal severity, in early infancy, when perhaps the error in diet has been so trivial that you can scarcely realise the possibility of its producing such formidable results. The fact, however, that in any given instance the convulsions depend on such a cause, may usually be gathered, partly from the history, which in early life is all the more important from the patient's inability to speak for himself, but still more from our observation of their characters. They are apt to be violent, accompanied with much spasm of the extremities, clenched hands, or the thumb drawn forcibly

into the palm, and the great toe widely separated from the other toes. They are associated with spasm of the larynx, which often remains closed till suffocation seems impending, and with much trouble of the respiratory movements; in other words, with evidence of all the spinal system of nerves being in a state of great irritation. Almost always, too, the abdomen in such cases is distended, often extremely tympanitic, and there is frequent escape of flatus from the intestines. These peculiarities, if borne in mind, will often give you a clue to the meaning of a violent and apparently causeless convulsive attack. They indicate the source of the disturbance to be eccentric, and thus both guide your treatment, and influence your prognosis, enabling you to hold out the hope that if the child do but surmount its present danger, recovery will be complete as well as speedy.

I referred to a second class of symptoms dependent on disorder of the digestive organs; symptoms less formidable in appearance, perhaps, but more delusive, by which irritation and exhaustion together simulate the effects of inflammatory disease of the brain. It is in diarrhoea, and especially in relapses of diarrhoea, that these two conditions are associated in the greatest degree, and that the risk of error is, perhaps, most considerable.

One case in illustration of it must suffice, for time draws short.

A little girl was seized with diarrhoea on August 8, which at first was severe, but soon yielded to treatment, and she was again convalescent; when, on the 15th, vomiting and purging returned with great violence, and were attended with much febrile disturbance. On the following day she was still worse in all respects, but was not brought to me again until the 17th. She then looked exceedingly ill; her face was sallow, but with a flush on each cheek, and her eyes were deeply sunk. She lay in a half-dozing state, with her eyelids half closed, and the eyeballs turned upwards, so that nothing but the sclerótica was visible; but from this condition she awoke frequently and suddenly in a state of great alarm, and looking as if she were about to have a fit of convulsions. Her skin was hot, and very dry; her pulse very frequent, but not strong; and there was some subsultus of the tendons of the wrist. The abdomen was rather tympanitic; the tongue red, coated with white mucus; the thirst was great; the vomiting very frequent, and the bowels acted two or three times in an hour, the evacuations having the appearance of dirty water.

The persistence of the diarrhoea, and the great frequency of the action of the bowels, coupled with the fact that I had observed the case from the commencement, would have rendered error inexcusable. But such cases may come under our notice only when the evidence of cerebral disturbance is already very striking, and when, perhaps, the diarrhoea is no longer very urgent—perhaps may for a few hours have altogether ceased: in such circumstances error is very possible, and its consequences may be very disastrous. If you regard the cerebral symptoms as the signs of active disease, and withhold the Dover's powder, or the opiate enema, that might have checked the diarrhoea, and soothed the irritability, while you apply cold lotions to the head, and give the child nothing more nutritious than barley-water in small quantities, because the irritability of the stomach, which results from weakness, seems to you the indication of disease of the brain,—the restlessness will before long alternate with coma, and the child will die either comatose, or in convulsions.

This is not indeed the only form which this spurious hydrocephalus assumes, although it is that in which the signs of irritation so mask those of exhaustion as to render the risk of mistake most serious; while the time during which the error can be rectified is in these cases very brief. In a larger number of instances this condition comes on much more slowly, since it results from the gradual influence of imperfect nutrition; and in these circumstances the signs of irritation of the nervous system which characterise its early stages are less marked, though not on that account less deceptive. In the infant brought up by hand, or imperfectly nourished at the breast, the first stage sometimes continues for weeks, attracting perhaps little notice; giving rise, indeed, to a vague suspicion that something is wrong, but yet this suspicion so indefinite that neither the parent nor the doctor pushes the inquiry far enough to decide what that something is; or, possibly, commencing dentition bears the blame of the whole

(b) "Recherches relatives à la Prédominance des Organes Digestifs des Enfants sur le Cerveau. Par J. Sabliarolles." 8vo. Paris, 1826

set of symptoms. I would have you, too, bear in mind, that in these cases dentition may really have much to do with the production of the symptoms, though not exactly in the way which at first suggests itself. The insufficient or unsuitable food heightens the irritability of the nervous system, and renders it preternaturally sensitive to the disturbance which teething seldom fails to bring with it. This disturbance acts, though more slowly, just as does that which accompanies diarrhoea; it exhausts the nervous power by all the manifestations of reaction which it produces, as the continued galvanic current wears out for a time the contractility of the muscles. The symptoms do not betoken real disease of the brain, though they closely resemble those which it occasions; so closely, indeed, that to read their import aright, you sometimes need go back for weeks, or even months, to gather the child's early history, and to learn how it has been fed, and how it has thriven from its birth. You will find, too, both in the past and in the present, intermingled with the general signs of cerebral disturbance, the evidences also of spinal irritation such as I have already referred to; and they should always lead you to suspect that the brain is disturbed in sympathy with some cause external to it. Irritability, restlessness, feverishness, a flushed face, a frequent pulse, undue sensitiveness of the surface, moaning, staring in sleep, all point to disorder of the nervous system, but they do not specially point to disease of the brain: their real meaning must be gathered from a consideration of the whole condition of the patient. That condition will be found to vary very much; the face will not be always flushed, nor the head always hot, nor the fontanelle always tense or pulsating. Vomiting may occur, but it will be occasional; the bowels will be relaxed rather than constipated; the abdomen not shrunken, but distended with flatus; a state which should always turn your attention from the brain itself to some source of irritation external to it; since, as the distinguished German physician, Goelis has remarked, a collapsed state of the abdomen, and the absence of flatus from the intestines, are signs almost pathognomonic of hydrocephalus. Often, too, the carpedal contractions and the laryngeal spasm are present, or have existed, to warn you as to the real nature of the case; while the pulse, though feeble and frequent, retains its regularity of force and rhythm, and thus differs remarkably from the irregular, intermittent, or unequal beats which are among the earliest and least fallacious signs of real cerebral disease. If misinterpreted, and consequently wrongly treated, the stage of exhaustion comes on by degrees, and with it a stealthy stupor. The flush no more returns to the surface, the extremities grow cold, the pulse becomes feeble, the pupils permanently dilated, the respiration sighing, the voice husky, deglutition difficult; symptoms which, if the earlier stage was misinterpreted, will probably be regarded as the signs of the last stage of hydrocephalus; though the depressed fontanelle, the cool head, the pulse still frequent in spite of its feebleness, the abdomen still containing flatus, the bowels still loose, will tell at once a different tale to some other Practitioner, who, with no larger experience than your own, yet with a mind unbiassed by a foregone conclusion, comes to the case, and at once reads its meaning aright.

I had wished to have said something about cases of a chronic character, in which symptoms occur that give rise to unfounded suspicion of disease of the brain, but there is to-day no time to do more than enumerate some of them. Such are the groundless suspicions which parents often entertain, and which the doctor himself is not always as quick as he might be to negative, in cases of essential paralysis in infancy and childhood. Such are the fears excited by the temporary though often long-continued dulling of the faculties, which often follows fever or some exhausting illness. Such are the apprehensions which fits of waywardness or altered temper excite; such, too, on the other hand, is the dread which the excitability of a child whose faculties are just awaking to the wonders of the world around him, sometimes occasions his relatives; and such, lastly is the morbid anxiety with which the severe neuralgic headache of childhood is watched by persons who can scarcely be persuaded but that suffering so intense, and the return of which Medical care so often fails to prevent, must needs depend on a cause as serious as it obviously is difficult of removal.

You see, gentlemen, my catalogue is a long one, and I think not unimportant. I must hope at some future time to pass it in review, as I have to-day tried to do with the other class of

cases of a more acute kind. Some of the details may, I fear, have seemed tedious; but my excuse is, that the errors against which I have tried to warn you are the same as in past years I have myself committed. I have not stated imaginary dangers. I have tried to warn you against such as have proved themselves to me very real ones, and to make you to the best of my powers the inheritors of my own experience.

ORIGINAL COMMUNICATIONS.

ON THE ACTION OF CERTAIN SUBSTANCES UPON PHTHISIS.

By RICHARD PAYNE COTTON, M.D.

Fellow of the Royal College of Physicians, London; Physician to the Hospital for Consumption and Diseases of the Chest, Brompton.

No. II.—IODIDE OF POTASSIUM.

IN a former communication (a) I expressed my intention of testing the action of certain medicinal substances upon consumption, by administering them to a number of Hospital patients, and carefully tabulating the result. On that occasion I noticed the effect of chloride of sodium; I have now to record that of iodide of potassium.

It may be as well, perhaps, to repeat that in these experiments, the cases have not been selected, but taken as they came into the Hospital, at whatever stage, and under whatever condition they might happen to present themselves; those only being excluded in which either some active symptom or unusual complication demanded more immediate and decided treatment. The present observations, like the preceding, have been made upon twenty-five patients; this number having been chosen as readily showing the result *per cent.* by the simple process of multiplying by four. To Dr. Hardy, the resident Clinical Assistant, I am indebted for frequent and carefully-made notes.

The iodide was administered in doses varying from five to seven grains, twice, and in some instances, three times a-day, simply dissolved in pimenta-water. The cases consisted of thirteen males and twelve females, their respective ages varying from 16 to 44, the majority being about midway between the two. In eleven, the disease was in its first stage; in two, softening had commenced; and in twelve, there was unmistakeable evidence of more or less pulmonary excavation. The medicine was continued, according to its effects, from a period varying from three to ten weeks. Whenever it seemed, after having been taken for four weeks, to be producing little or no good, it was discontinued, and the subsequent progress of such patient under other treatment carefully observed.

In two instances, headache was complained of; in six, there was more or less dyspepsia, flatulence, or loss of appetite; and in three cases, hæmoptysis occurred. Whether such symptoms were the *post* or the *propter hoc* it was rather difficult to determine; there seemed to be no reason, however, for suspecting the latter in the cases of hæmoptysis; but, from subsequent observation, the headache and dyspepsia were fairly attributable to the iodide.

In order to obtain comparative results, in eight cases the iodide was combined with cod-liver oil, and in seventeen administered alone.

There was a visible improvement in eleven of the patients; six of these being in the first stage of the disease, and the rest more advanced; in six instances there was no change either one way or the other; and in eight the disease advanced more or less rapidly.

In making an analysis of the eleven improved cases, it was found that in six of the number the iodide had been taken in conjunction with cod-liver oil, and that in five it was taken alone. The most marked improvement was certainly where the two had been associated. In only three cases, where the iodide had been taken by itself, had the patient's weight increased, whilst in ten it had diminished, and in four remained unchanged. Out of the entire twenty-five cases, therefore, only in five could it be fairly argued that the iodide had been

(a) Medical Times and Gazette, May 28, 1859.

of service; and when it is remembered that patients coming into the Hospital are immediately placed under greatly improved circumstances, both as to general hygiene and diet the good effect of the medicine, even upon these five patients is very far from being demonstrated.

Four patients, who either had received no benefit from the iodide, or with whom it had disagreed, improved afterwards very much, and gained considerably in weight, under the administration of steel and cod-liver oil.

In four cases, during the use of the iodide of potassium, there was a marked amelioration in the pulmonary symptoms; the breathing became less difficult, and the cough and expectoration diminished; but here again it is fairly open to question whether such improvement was due to the iodide, or to other and concomitant circumstances.

From the above observations I think we may arrive at the following conclusions, viz. :—

1. Iodide of potassium given in moderate doses to consumptive patients, occasionally produces dyspeptic symptoms; but more commonly is unattended by any marked result either in one direction or the other.

2. Under its use the weight is seldom increased, but either remains stationary, or is diminished; the latter effect being of most frequent occurrence.

Clarges-street, Piccadilly.

THE RESULTS AND TREATMENT OF CROSS PRESENTATIONS

By CHARLES DAVID DOIG, M.D. Edin.

It is generally conceded that the value of an art or science is enhanced by the useful applications to which it may be put. To save life is of the highest importance in the business of the world, and many ingenious contrivances have been suggested, and are in use, with this object. The "safety lamp" of Sir Humphry Davy, and the common lightning-conductors, furnish familiar examples.

The class of labours that I purpose to consider for a few minutes differs from others that are more frequent, such as cephalic and breech presentations, in the almost inevitably fatal result that must attend their occurrence, in the case of the mother at least, unless timely aid be afforded by Surgical art. Indeed it is the result of experience, that not only is there extreme danger to the life of the mother, but that the life of the child is situated in no less peril. It is my intention, then, in the following practical observations, to consider some of the more important topics relative to transverse presentations.

Case 1.—In April, 1851, a female about 40 years of age, a moderately large, well-made woman, the mother of several children, near the time of her delivery, accidentally sustained a kick on the abdomen, and did not feel well afterwards. Some days after this misfortune I was requested to visit her. On interrogatory and vaginal examination, I ascertained that the waters had dribbled away, that the pains were strong, and that the maternal passages were heated and imperfectly dilated. By careful manipulation, I distinguished the shoulder, ribs, and spine of the vertebræ, and subsequently an arm, the essential indications of a cross presentation. As she was too weak to bear venesection, a combination of opium and antimony was prescribed, with the object of somewhat subduing uterine action, and relaxing the maternal passages. When the os was fully dilated, I gently introduced my hand into the uterus to perform podalic version, but was compelled to desist in consequence of the grasping action of the uterus. As the same result attended every such attempt, chloroform was administered, and turning at length effected. The fetus was full-grown and putrid. The mother died a few hours after delivery. She had been forty-eight hours in hard labour, and was evidently sinking before turning was performed.

On making a post-mortem examination I ascertained the presence of rupture of the uterus near the cervix. The death of the mother appears to have been consequent on rupture of the uterus and exhaustion induced by long-continued and violent action of the organ. The blow appears to have been the exciting cause of parturition, and to have caused the early evacuation of the liquor amnii. It is well known that

puncturing the membrane, and thereby evacuating the waters, is an efficacious means of causing delivery before the normal end of gestation.

Occasionally rupture of the uterus occurs as a complication of natural labour, as the following case illustrates.

Case 2.—A gentleman, in 1852, requested me to make a post-mortem examination of a patient of his who had suddenly died in childbed without any assignable cause. Her labour had been an easy one. In this case I observed rupture of the uterus near the cervix. The presentation was cephalic, and the patient had been exempt from the continued and severe uterine efforts that characterised the previous case.

It would appear, then, that death of mother and child is the natural result of transverse presentation of a full-grown fetus in the uterus of a well-developed female; and that rupture of the uterus, a very dangerous complication, although most likely to occur under these circumstances, may also be developed in the course of easy natural labour.

Before proceeding further, let us see what light statistics throw on this formidable and very fatal accident. Dr. Burns says that it occurs about once in 940 cases. Dr. Churchill in 1331 cases, or 85 cases in 113,138 patients. The following table shows in what pregnancies laceration of the uterus is most frequent. It is constructed from data furnished in Churchill's book on the Diseases of Women :—

Pregnancy	J. Clarko	Collins	McKeever	Ramsbotham.	Hooper	Kito	Partridge	Total	Selected from Trask's Collection.

	7	34	18	6	4	1	1	71	150

It may occur in what is called interstitial foetation. It may arise from abscess, or from softening of the walls of the uterus, from thinning or other disease of the uterine fibrin, or from mechanical violence, or fatigue. Rigid os or occluded vagina may occasion it. With regard to the effect of the presentation Dr. Trask narrates that out of 303 cases there were only 16 presentations of the shoulder, arm, or side, and 2 of the breech, the remainder being head presentations.

The following narrative indicates the important fact that Nature, under circumstances different from those specified in Case 1, accomplishes delivery with safety to the mother, and this by a process on which the proper treatment of transverse presentation is founded, viz. spontaneous evolution.

Case 3.—In March, 1854, a young female, not a primipara, requested me to attend her at her confinement. She was a healthy female, of moderate stature, and had a well-formed pelvis. Labour came on about the seventh month. On being summoned, and making a vaginal examination, I ascertained that the shoulder was the presenting part. After some delay, to see what Nature would do under the circumstances, I administered chloroform freely, and made repeated but unsuccessful efforts to turn. These failed on account of the slipperiness of the child. Just as another effort was on the point of being made to effect delivery in this way, viz. by version, the immature fetus doubled up, and came away feet first, of course dead. It just appeared to have put its shoulder against the walls of the pelvis, and, with the aid of uterine contraction, to have vaulted into the world. The mother made a good recovery.

The following case illustrates the treatment applicable to this presentation, and the conditions which favour a fortunate result to the mother.

Case 4.—In June, 1853, I was called to visit a Mrs. S., a patient of mine, in labour. She was about forty years of age, asthmatic, a moderately large well-made lady, the mother of several children. She had had nothing particular about her previous labours. On examination, the passages were well dilated, the pelvis of the mother capacious, the waters had not escaped, and the shoulder was the presenting part. After

ascertaining the state of the bladder and bowels, I introduced my hand into the uterus through the bag of waters, and changed the presentation to a footling case. A short time elapsed, and I extracted a fine mature fœtus, but it was dead. The mother made a rapid recovery. The only medicine prescribed for her was a dose or two of castor-oil, and a few draughts containing sulphuric ether, laudanum, and camphor mixture.

Version may be used with better fortune than indicated in the last case, viz. with safety to both child and mother. I attended a case of labour with a friend of mine in 1850, in which version was performed with perfect success, mother and child having been both saved.

It is my intention to occupy the remaining portion of this paper with the consideration of the Anatomy, Etiology, Statistics, and Treatment of Cross Presentations.

The ovoid of the fœtus is situated across the pelvis of the mother in cross presentations, and the parts that present under these conditions are, as might be *a priori* expected, the shoulders, arms, hands, neck, breast, back, and abdomen. Sometimes the occiput and back of the child look anteriorly, sometimes posteriorly.

The cases detailed appear to me to support the theory that reflex action governs the attitude of the fœtus *in utero*, and that the loss of sensibility consequent on the death of the fœtus, removes the fœtus from the usual vital laws, and leaves it under the influence of other physical laws.

The following figures, taken from "Churchill's Midwifery," expose the frequency of this class of presentations, as compared with others:—

Name of Author	Total Number of Cases	Head	Breech	Inferior Extremities	Superior Extremities
Madame Boivin	20,517	9,810	372	238	80
Madame Lachapelle	15,652	14,677	349	255	68
Dr. Joseph Clarke	10,387	9,748	61	184	48

Dr. Maunsell	839	786	1	21	4
Mr. Gregory	691	645	14	7	4
Dr. Collins	16,414	15,912	242	187	40
Dr. Beatty	1,182	1,105	28	15	4
Mr. Lever	4,666	4,266	59	29	12
Dr. Churchill	1,640	1,119	35	22	9

Dr. Davis, a recent authority on midwifery practice, gives statistical details of a minute character, which are worthy of reference here. His observations are taken from 7302 deliveries, of which 7233 were single births, and 69 twin births. The presentations among these births were as follow:—

7233 SINGLE BIRTHS.			
Head presented in	6698	or 1 in	1.079

The number of pure cross-presentations (indicated by asterisks) amounts to 25 in 7302 deliveries, of which the

shoulder presented in 5 instances, the elbow in 3, the arm in 10, one or both hands in 7. The same gentleman remarks that of the above transverse children, 10 were born living, or 40 per cent. of cross births; and 15 still-born, or 60 per cent. of cross births. In 22 cases turning was performed, in 2 embryotomy was necessary, one was born at 6 months.

Dr. Davis states that version was performed 35 times under the following circumstances:—shoulder presentation, 4; elbow, 3; arm, 10; hand, one or both, 7; shoulder and funis, 1; arm and funis, 1; hand and funis, 1; hand and placenta, 1; placenta prævia, 5; accidental hæmorrhage, 2; 11 children were saved, or 31.429 per cent.; 24 children were still-born, or 68.571 per cent. in these 35 instances. The average loss of life to mothers under these circumstances is ordinarily considered to be 1 in 9. According to Dr. Ricker it is 1 in 14.

The elaborate researches of Dr. Ricker, of the Duchy of Nassau, give larger statistical information on this interesting topic. He gives the obstetric statistics of the Duchy from 1821 to 1842, inclusive. The population of the Duchy of Nassau is 429,341, and the births during the above period amount to 304,150, of which there were: forcep cases, 4233 or 1 in 72, $\frac{1}{4233}$; head turning, 10; foot turning, 2473, or 1 in 123; perforation, 143, or 1 in 2126; embryotomy, 22, or 1 in 13,825; artificial premature labour, 3, or 1 in 101,383; Cæsarean section in living, 12, or 1 in 26,000; Cæsarean section in dead, 27.

The causes of turning in 530 of these 2473 cases of operation were in 388 instances cross presentations; 82, placenta prævia; 28, prolapsus of the umbilical cord; 18, contraction of the pelvis; 5, hæmorrhages; 4, various dangerous diseases of the mother; 2, face presentations; 2, oblique position of the head; 1, convulsions.

The results of 2473 cases of turning were that 176 mothers died, and 1431 children were either still-born or died shortly after birth; thus 1 mother in $14\frac{2}{7}$ was lost, and for every $11\frac{2}{3}$ child one was lost. Dr. Ricker attributes part of the mortality to the presentation not being detected till the membranes had burst, thus showing the necessity of early making out the presenting part, and consequently of having attendants conversant with the varied phases of disease, and skilled in the resources of Medical art.

In the preceding observations have thus been established the mortality attending the operation of turning to both mother and child. The frequency of podalic turning, as compared with other peculiarly obstetric operations, and with obstetric practice in general, and especially the frequency of cross presentation as a cause for turning. The above remarks, then, indicate that although version is the treatment adapted to meet the exigencies of cross presentation; yet, occasionally cases occur in which it is necessary to resort to embryotomy, when the diameters of the pelvis, or other cause, contraindicates version.

The rules to be observed in performing the usual operation of turning are, after rupturing the membranes near the os uteri, gently to insinuate the hand into the uterus, following the direction of the axes of the pelvis, then to advance the hand along the anterior surface of the child, seize one or both feet or knees, alter the position of the child to a footling case, and extract with a gently wavy motion. Sometimes the latter part of the operation is left to be completed by Nature. Such is the method adopted while the bag of waters is entire; but should these have been evacuated, the performance of the operation becomes much more difficult. Venesection, antimony, opium, and chloroform, are invaluable adjuncts in these as well as in many other cases requiring Surgical aid.

Seafield, Leith.

UNIVERSITY OF DUBLIN.—At the Winter Commencement held on Wednesday, the 14th inst., the following Degrees in Medicine and Surgery were conferred by the Right Hon. the Lord Justice of Appeal, Vice Chancellor of the University:—Doctores in Medicinâ—Ricardus Dane, Thomas Gulielmus Shea. Baccalaurei in Medicinâ—Edvardus Stamer O'Grady, Johannes Butler Hamilton, Philippus Crampton Smyly, Jacobus Robertus Gausson. Magister in Chirurgiâ—Edvardus Stamer O'Grady. At the same Commencement the honorary Degree of Doctor of Laws was conferred upon Captain Francis Leopold M'Clintock, R.N., the intrepid commander of the *Fox* yacht, and brother of the present Master of the Dublin Lying-in Hospital.

THE LONDON
PRACTICE OF MEDICINE AND SURGERY.

ST. BARTHOLOMEW'S HOSPITAL.

TWO REMARKABLE CASES OF FALSE
ANEURISMAL TUMOURS IN WHICH OPERATIONS
WERE PERFORMED.

(Under the care of Mr. STANLEY.)

THE two following cases both of them present features of unusual interest and rarity. We have given the notes of the first of them exactly as they had been written out for publication, before the doubt which surrounded the case had been cleared away by the operation. It was, perhaps, one of the most puzzling which could well be imagined, and we have endeavoured to preserve to our readers a clear transcript of the anomalous features which rendered it so. It will be seen that Mr. Stanley's conjecture that some lesion of the profunda must be the cause of the tumour, eventually proved to be the correct one.

In Mr. Skey's case there was much less doubt as to the nature of the tumour, though scarcely less difference of opinion as to the manner in which it should be dealt with.

Large tumour of doubtful nature in the inner part of the thigh lifting up the femoral artery—Slight pulsation and aneurismal whizz in the tumour—Ligature of the external iliac—Evacuation of the tumour—Death—Autopsy—Rupture of the profunda and false aneurism.

James D., aged 35, a carman, admitted November 18. He is a temperate well-nourished man of rather sallow complexion, but good general health. He states that before the 13th there was no appearance whatever of swelling, and that he was perfectly well; he then noticed a swelling the size of a walnut, hard and incompressible, at the upper and inner aspect of the thigh, which has since steadily increased in size, but without pain; the only inconvenience being from walking a long distance to his work. He does not remember to have had a blow or any injury. On admission, a rounded, firm, resistant tumour extended down the middle third of the thigh, causing the limb at that part to measure twenty and a-half inches in circumference. The femoral artery was felt pulsating forcibly, and could be traced from above, over, and to the outer side of the tumour, where the pulsation ceased. Pulsation in the popliteal artery was felt by some who examined it, but not by all. No pulsation could be detected in the posterior or anterior tibial arteries. The temperature of both limbs was pretty much alike. There was no tenderness or pain in the tumour, and there was no œdema of the lower extremities. Considerable doubt was felt as to the nature of the tumour; and it was carefully examined by nearly all the members of the Hospital staff. The possibility of its being a psoas abscess, an ordinary abscess, a morbid growth, a blood-tumour arising from the sudden rupture of small arteries, effusion of blood from the profunda, etc., was considered, but no positive opinion was given. The patient was directed to be kept quiet, and lotio plumbi was applied to the part.

On November 22, the following note was made of the case:—"Hitherto nothing of further importance has occurred; last night, however, he had shooting and pricking pains in the part, which have now left him. The tumour is much the same in volume, and the patient complains of no uneasiness. Pulsation can now be distinctly felt in the popliteal artery, but none in the anterior or posterior tibial arteries."

30th.—The tumour is to-day somewhat more rounded and softer, in parts communicating a sense of fluctuation to the finger. He complains of some throbbing pains. Mr. Wormald to-day examined him, and thought he could detect pulsation in the posterior tibial artery. He also traced pulsation in the femoral as low as the entrance into the sheath of the adductors. Mr. Stanley suggested that the absence of pulsation below this point might be due to the tendons of the muscle pressing on the artery, and thus impeding the circulation.

Dec. 1.—The patient has complained of greater pain and "shooting" in the thigh. The tumour appears more rounded and circumscribed, and there is more sense of fluctuation. The femoral artery beats more forcibly than usual, the popliteal also beats more strongly, and pulsation is now plainly felt in the posterior tibial. He was seen to-day by Mr. Lawrence and Mr. Wormald, in consultation with Mr. Stanley, and they pronounce the case to be as obscure as ever.

On Saturday, December 3, a consultation was again held; the tumour had increased in size, and had been attended with more pain; it was softer. There was, however, no œdema of the leg, and no enlargement of the veins. Opinions were divided as to its nature. It might have been an abscess, an aneurism, or a mass of encephaloid. A grooved needle was introduced to-day, in order to ascertain whether the tumour contained pus or blood. A small quantity of blood was obtained, and it was doubtful whether this was more than might have been expected, irrespective of the diseased mass. On the 4th, Mr. Stanley introduced a very small trocar, and having withdrawn the stilette, passed a probe through the canula. The probe passed readily into what appeared to be a cavity, moving freely about; some blood was again obtained, but it was not arterial. On Thursday, December 8, another consultation was held. The tumour had much increased during the two preceding days, and there was now some fluctuation. The case was still very obscure. Pulsations could be distinctly heard, and some thought that the whizz peculiar to aneurism could be heard also. There were, Mr. Stanley stated, apparently two things which it might be, viz., aneurism of the profunda, or one of those cases of blood-tumour arising from many small arteries—cases, he remarked, which had been described by Mr. Hodgson. After a full consideration of all the points of the case, Mr. Stanley determined to tie the external iliac, as, in his opinion, and that of the majority of experienced Surgeons consulted, it gave the man the best chance. The patient was removed to the operating-theatre, and when he was placed under the influence of chloroform, Mr. Stanley applied a ligature to the external iliac above Poupart's ligament. In reference to the site of ligature, Mr. Stanley remarked, that experience showed that ligature of the artery above Poupart's ligament was a more successful operation than ligature of the common femoral just below that ligament; as in the latter position the arterial branches given off interfered with the formation of clot, and subsequent obliteration of the artery.

Since the above was written, we regret to state that the man has died. The following is the further history of the case, the particulars of which we have obtained from the case-book of Mr. Rogers (House-Surgeon), and from remarks made at an excellent clinical lecture upon it by Mr. Stanley.

The following note was made of his condition on the evening of the day of operation, Thursday the 8th. "9.30. p.m.—The patient has been quiet since the operation; has not complained of any sickness or vomiting. The tumour is about the same size as before the operation. It can now be pressed without eliciting pain. He only complains of the soreness of the wound. The limb is warm, and he feels an inclination to sleep. His spirits are better, and he expresses himself as being more comfortable."

The next day (Friday) he was doing well. He had a quiet night. He continued to progress favourably until the 11th (Sunday), when he became much worse. "He has had more pain, and is at times delirious. His tongue is furred and dry. There is a kind of fermentive smell about the wound. The pulse continues sharp and jerking (128), though still feeble. There is more languor; eyes sunken; bowels confined. The tumour seems to have increased in size, especially on the outer side, and is more soft and fluctuating, and when pressed between the fingers gives rise to a splashing sound. To the touch, it seems as if air were mixed up with the fluid."

Under these circumstances, Mr. Stanley and Mr. Lawrence decided that an incision should be made into the mass, and the contents turned out. An incision, about four inches long, was made into the tumour; immediately gas escaped, and shreds of puriform matter, which were very fetid. The pus afterwards ceased to escape, being evidently quite superficial. Large masses of coagulated blood were now removed, scooped out by a tablespoon. About eighteen ounces were thus taken out. A large fist might easily have been introduced into the cavity. The bone was exposed in the upper part of

the hollow, though, at the lower part, the periosteum remained. He expressed himself as being much relieved by this operation, and at 10 p.m. it was noted,—"No delirium; no rigors; and the pulse, though still 128, is soft and compressible." A poultice was applied, and thirty drops of Battley's solution was given, and beef-tea and brandy were freely administered during the night. Delirium, however, returned; he was very restless and incoherent. The next morning (Monday, 12th) he was evidently much worse; his eyes dull and sunken; the features drawn; sordes collecting about the lips; tongue dry, and thickly furred; breathing laborious; deglutition difficult; pulse 132. There was also a putrid odour about the limb. The cavity was syringed out; the limb was enveloped in cotton-wool, and bags of charcoal were placed near the wound. Ammonia and chloric ether were administered; beef-tea, brandy, etc., were steadily and frequently given. In spite of the most assiduous treatment, he sank, and died at half-past four on the morning of the 13th.

Autopsy, twenty-one hours after Death.—An incision was made in the hypogastric region, on the left side of the wound, and another from Poupart's ligament to the knee. There was nothing of importance to note about the abdomen; there were a few old adhesions between the peritoneum and abdominal walls. The intestines appeared healthy. There was no mischief in the pelvic cavity. The external iliac artery was laid open, and following it down the femoral and profunda were also exposed. The notes made of the examination go on to state:—"The walls of the vessels were quite healthy; neither ossific nor atheromatous deposit were to be found. The coats were perfectly preserved." At the point of ligature there was no suppuration. On section and cutting open the artery, it was found that the two inner coats of the artery were divided, and the outer one entire. A conical clot, half-an-inch in length, extended upwards from the point of ligature, at which spot the sides of the vessel were already connected with lymph. It was found that the external iliac was tied about half-an-inch above the epigastric and circumflex ilii, and about an inch above Poupart's ligament. It was found that the profunda was given off from the common femoral only three-quarters of an inch below Poupart's ligament. On following this vessel, there was found, about four or five inches from its origin, a longitudinal rupture of the vessel about one-third of an inch long, over which was spread a fibrinous band; this opening led into the cavity from which had been taken the coagulated and putrid blood; two or three coagula still remained. The femoral and profunda, in the whole of their extent, appeared to be perfectly healthy. The middle third of the femur was removed; the upper part of which was bare, and presented some rough spiculæ, the result probably of irritation and inflammation consequent upon contact with the effused blood. The lungs were perfectly healthy. The tricuspid and pulmonary valves of the heart were normal. The mitral valves were the seat of disease. The aortic valves were fringed with indentations, and presented the appearance which, Mr. Stanley remarked, Corvisart the elder called "syphilitic vegetation." One of the valves was ulcerated. The left ventricle was hypertrophied, and contained fibrinous deposits. Mr. Callender subsequently re-examined the seat of rupture in the profunda, and found there calcareous deposit.

Mr. Stanley, at the clinical lecture alluded to, dwelt particularly on the question of the seat of ligature. He said that it was a fact pretty well established, that the profunda very rarely arose more than two inches below Poupart's ligament: but that it very frequently varied in its origin within those limits. In this case, as stated, it arose from the main artery, *one-third of an inch below Poupart's ligament*; and therefore ligature here would have been extremely dangerous. Mr. Stanley mentioned, *en passant*, that he had once dissected a case in which the profunda arose six inches below Poupart's ligament, and another in which it arose immediately beneath that structure.

On Monday last, December 19, Mr. Skey operated for an aneurismal tumour in the axilla. Its nature prior to the operation was extremely doubtful. The following short history of the case, and the features presented by it, were obtained from the remarks made by Mr. Skey after the operation. The subject of the tumour was a woman, aged 53. Three months ago she slipped and fell with the right arm extended. The head of the humerus was dislocated into the

axilla. She suffered intense pain. It was not until forty-eight hours after the accident that she received attention. She was then sent by the overseers of the parish into the workhouse, but did not see a Surgeon for a day or two after that. The Surgeon who supplied Mr. Skey with the early history of the case, states that he reduced the dislocation, and that the patient did well for three or four weeks; she then began to perceive a swelling in the axilla, attended with pain. Mr. Skey here remarked, that in ninety-nine cases out of a hundred, no such swelling would follow, and that under such circumstances the Surgeon very naturally took it for an abscess. It was cut into on this supposition, and two or three ounces of blood escaped. When first seen by Mr. Skey, on Friday, the 9th instant, there was a swelling in the axilla, under the pectoral muscle, and the mark of a small puncture. The arm was cedematous, and the radial and ulnar arteries did not pulsate. On the Monday following, it was found that pressure on the subclavian artery reduced the size of the tumour. This was decided, and was noticed by several gentlemen. The tumour, as Mr. Skey observed, had many points in common with Mr. Stanley's case (see above). The blood was evidently effused into the cellular tissue, and it was therefore not a true aneurism. Great differences of opinion were expressed as to its nature, and as to the treatment to be adopted,—either to ligature the subclavian, or to cut down into the mass and find the wound in the artery. After balancing carefully the various opinions, Mr. Skey determined to cut into the tumour, turn out the clot, and find and secure the artery at its injured point. At the operation, the patient, a thin, delicate, cachectic-looking woman, was placed under the influence of chloroform. The subclavian artery being firmly compressed upon the clavicle, Mr. Skey made an incision in the tumour about three inches long, and then turned out a large quantity (nearly a pint) of coagulated blood. There was a slight rush of blood, but this was quickly and effectually controlled. Mr. Skey then, after a little cautious dissection, succeeded in finding the source of hæmorrhage, and so applying his ligatures that it was entirely controlled. Very little blood was lost during the operation. Mr. Skey remarked that the patient was (though placed under the best possible circumstances for recovery) still in a very doubtful state.

LIGATURE OF THE COMMON CAROTID FOR HÆMORRHAGE FROM THE TONSIL.—RECOVERY.

(Under the care of Mr. STANLEY.)

We are glad to be able to furnish further particulars in the history of the case of Ligature of the Carotid, the former particulars of which will be found in our pages for October 29, p. 429.

The case up to the morning following the operation is fully recorded, though it is in one particular erroneous. The hæmorrhage from the tonsil at the time of the puncture was very slight, and the great losses came on some time after at repeated intervals. The following details of the operation will also not be out of place. An incision, an inch and a-half in length, was made over the direction of the artery. The descendens noni nerve, where it lies on the carotid sheath, was seen, and turned aside. The artery was secured by a ligature of Glasgow twine, about three-quarters of an inch below the bifurcation.

Since the operation the man had no untoward symptoms; the hæmorrhage did not recur; the ligature fell on the fourteenth day. On November 18, the following note of his case was made by Mr. Rogers, House-Surgeon (to whose kindness we are indebted for the particulars of the case):—"The patient is going on quite well, and for the last few days has left his bed. December 2.—The man has steadily improved; the wound is nearly healed; no pulsation can yet be felt in the facial or temporal arteries of the affected side. He is so nearly well, that he is anxious to go out; but Mr. Stanley thinks it advisable that he should remain a little longer. There does not appear to have been any cerebral symptom of any kind, except a little sleeplessness one night, which is referred to excitement from his anxiety, etc."

Cases in which bleeding after the puncture of an abscess in the tonsil is so profuse as to require further surgical interference are very rare. Excepting the one given above, and a second about to be recorded, we scarcely recollect a single instance of such in the whole of the London Hospitals during the last five years. It singularly happens that the two cases

occurred within a day or two of each other. In both the bleeding was profuse and occasioned serious anxiety as to the life of the patient. We append to Mr. Thompson's case a few remarks as to its probable source.

THE MARYLEBONE INFIRMARY.

HÆMORRHAGE FROM THE TONSIL AFTER INCISION.—ARREST BY THE PERCHLORIDE OF IRON.

(Under the care of Mr. HENRY THOMPSON.)

A charwoman, aged 35, was admitted into the Marylebone Infirmary at noon, October 22. It appeared that she had been suffering from acute tonsillitis, and that two days previously a Surgeon had punctured one tonsil in the hope of letting out pus, and on the following day its fellow with like object. As far as she knew, however, no matter was obtained on either occasion, but there was very free bleeding on both. She had at the time of her admission had no hæmorrhage since that immediately following the last puncture; but late in the evening of the day on which she was admitted the bleeding again set in. Thus, then, there had been an interval of twenty-four hours between the last puncture, and the recurrence of hæmorrhage. From about half-past ten, the time at which the recurrent bleeding set in, her loss continued without intermission until twelve, when her symptoms had become such, that the House-Surgeon of the Infirmary deemed it necessary without delay to summon Mr. Henry Thompson to see her.

Mr. Thompson on arrival found the woman in a most urgent condition from the effects of loss of blood. She was propped up in bed, pale, and almost pulseless, and unable to speak so as to be understood. A large vessel by her side contained coagulated blood, and by subsequent measurement it was ascertained that she could not have lost much less than four pints. On examining the throat with his finger, Mr. Thompson distinctly felt a small opening, as if from an incision in the front of the right gland, and from this blood was freely flowing. The mouth and fauces were so filled with coagula that it was impossible by candle-light to distinguish any arterial jet. The bleeding had not been a continuous oozing, but had been almost suspended at times, especially when the woman had become faint.

The woman's condition being such as to admit of no delay, Mr. Thompson at once prepared to place a ligature on the carotid, and the needful instruments were got in readiness. Before doing so, however, he determined, though without much hope of being successful, to make a trial of the perchloride of iron. This was done by carefully mopping the part dry by means of lint wrapped on the left forefinger, and then pushing a glass-brush dipped in the fluid into the incision. After a few applications the bleeding was entirely stopped; in about a quarter of an hour, however, a slight recurrence necessitated a repetition of them, which were again successful. No return took place afterwards. The woman slowly regained her strength, and made ultimately a complete recovery.

Mr. Thompson stated that, although he had on several previous occasions easily arrested very formidable hæmorrhages by resort to the perchloride solution, yet that on the present occasion he had not at all expected to be able to do so. He spoke most strongly as to the value of this agent when properly prepared according to the French codex.

REMARKS ON THE PROBABLE SOURCE OF THE HÆMORRHAGE IN THE ABOVE CASES.

A very important question will present itself to all readers of these two instructive cases, as to whence the bleeding probably proceeded. In neither Mr. Stanley's case nor the one last given was there any reason to suspect that the patient was of hæmorrhagic diathesis. In each instance the patient had two wounds (in Mr. Thompson's that of the other tonsil, in Mr. Stanley's that of the operation), whilst but one of them bled—a fact almost conclusive against any theory as to peculiar diathesis. In Mr. Thompson's, the mode of cure makes it all but certain that the carotid could not have been wounded; and in Mr. Stanley's there are some facts in the history not in keeping with such an hypothesis. Moreover in Mr. Stanley's the

hæmorrhage had not been greater than in the one last reported. The position of the carotid is such as to make a wound, in an attempt to puncture the tonsil, an occurrence which could only take place under very unusual circumstances. The thrust must be very bold indeed and very awkwardly directed which could pass through a large and swollen tonsil and enter the main artery. It is very probable that in both these cases the wound was of some branch, perhaps abnormally large in the first instance, and still further increased by the inflammation of the part. The ascending pharyngeal is a vessel which might easily be divided under such circumstances.

GUY'S HOSPITAL.

SYMPTOMS OF FRACTURED BASE OF SKULL.—RECOVERY.

(Under the care of Mr. HILTON.)

INSTANCES of recovery after fracture of the base of the skull, although proved to occur sometimes, are decidedly rare. We are, therefore, glad to place the following case on record, in addition to some of like nature, which will be found in our Hospital Reports on former occasions.

As far as hæmorrhage from the ears, continuing for a considerable period, and followed by the discharge of clear serous fluid, when occurring in conjunction with other head symptoms after a very violent concussion head downmost, can be held to establish a diagnosis of fractured base, we can in the present instance regard it as beyond doubt. Mr. Hilton, who repeatedly directed the attention of the students to these peculiar symptoms and their signification, stated that he felt no doubt as to the nature of the injury which the man had received.

Report of the case of a man who had received a blow upon the back of his head, which was followed by hæmorrhage from the nose, mouth, and ears; admitted in collapse, and with symptoms of concussion of brain.—Subsequent discharge of cerebro-spinal fluid from one ear.—Recovery.

[By WILLIAM THOMAS SALMON, Dresser.]

J. G., aged 22, an engineer, was admitted into Guy's Hospital, November 9, 1859, at five p.m., under the care of Mr. Hilton. While intoxicated by spirits, but not drunk, he had attempted to get out of a cab, going fast, and in doing so his feet were carried from under him, and he fell with great violence, striking the back of his head upon the stone pavement.

Symptoms when admitted (fifteen minutes after the accident).—He was in a collapse, and scarcely conscious; the pupils acted slightly; the pulse was slow, feeble, and very compressible; hæmorrhage proceeding from both ears, from the nose, and from the mouth; no paralysis observed. Three ounces of brandy were given.

Nine p.m. (four hours after admission).—Has had three attacks of vomiting of blood; the pupils answer freely to light; the hæmorrhage from the nose and mouth has stopped, but that from the ears continues, and is much more free from the left ear; skin cold; reaction as yet but slight; pulse 70; breathing natural; no stertor; slightly aroused by shaking; moves his arms and legs at will; respiration 20 per minute; refuses and spits out the medicines administered. Two ounces more brandy were now given.

Half-past twelve.—Has had no more attacks of vomiting since nine o'clock; speaks rather sensibly; desires to be left alone, and not disturbed. A dose of five grains of calomel given.

Nov. 10.—Seen at nine in the morning; perfect sensibility; complains of headache and thirst (pain especially over the temples and forehead); skin hot; pulse 78; sat up in bed, and passed his water. Ordered cold to head, and an effervescent mixture.

Three p.m.—Skin hot; pulse 75 to 80. Ordered pulv. hydrarg. cum cretâ, gr. v. nocte maneque; ice to head; milk diet.

Nov. 11th.—Complains of pain in the forehead, but none in the occiput. Pulse 60; bowels rather relaxed.

12th.—Symptoms the same; pulse 60; complains of great pain; ice kept to head; bowels well open.

13th.—Is quite conscious but by no means rational, inas-

much as he continually wishes to get up and go home; pulse 60, hardly any headache.

14th.—Slight pain in the ears, worse in the left one, and also slight hæmorrhage from them. He spits up small coagula of blood in his sputa; pulse 75; all pain in the head gone. Rep. pil. hydrarg. cum cretâ, carb. amm. gr. v. ex julep, amm. acet. ter die, to go on with the milk and water diet, and add a little beef-tea.

15th.—About the same; pulse 65.

16th.—Skin cool; pulse 60.

18th.—Skin moist; pulse 75. Complains that his left ear aches if he lies on it; bowels open.

19th.—Slight discharge of cerebro-spinal fluid from the right ear, but none from the left one, which was the one from which there was the greatest hæmorrhage. Pulse 75; feels comfortable, appears sensible, but is not at all rational in his wishes.

20th.—The discharge from the right ear is increased; no pain; slept well; temperature of the head normal; pulse 80.

21st.—The same; the discharge from right ear continues, enough to soak the piece of wool which is kept in it; pulse 80; bowels costive. A saline aperient was prescribed.

22nd.—Continues improving.

23rd.—Feels quite comfortable; the discharge from the ear nearly stopped; bowels open.

24th.—The same; put on middle diet (meat, $\frac{1}{2}$ lb.; potatoes, 1lb.)

25th.—Improving; the discharge stopped.

26th.—Bowels open; quite rational and collected.

27th.—The same, and has continued to improve daily ever since.

December 10.—Discharged. He can now hear with either ear, but not accurately; the tick of a watch being as distinctly heard when the watch was placed upon the scalp, above the external ears, as when placed upon the ear itself. The patient was not allowed to leave his bed during the first three weeks after the accident; Mr. Hilton not considering it safe for him to do so.

NOTES AND QUERIES.

He that questioneth much shall learn much.—*Bacon.*

No. 397.—WHO ANATOMISED GEORGE II?

A reply is requested to the following query.—Where may I find an account of the post-mortem examination of the body of King George the Second? I find the following in Wishart's translation of Scarpa on Aneurism:—"Morgagni and Nichols had occasion to observe the commencement of an aneurism under the appearance of ecchymosis. In the history which the latter has given on the dissection of the body of George II., late King of England, he says he found a fissure in the internal surface of the aorta," etc.

London.

INQUIRER.

No. 398.—BARBER-SURGEONS.

"Formerly the business of a Surgeon was united to that of barber, and he was denominated a barber-surgeon. A company was formed under this name in 1308, and the London company was incorporated 1st Edward IV., 1461. This union of profession was dissolved by a statute of Henry VIII."—*Haydn's "Dictionary of Dates."*

"It was in the early part of the professional career of the celebrated Mr. Pott, that the Surgeons separated themselves from the Company of Barbers."—"Professional Anecdotes," London: 1825.

No. 399.—THE PURE EMPIRIC.

"The Pure Empiric is the intelligent Practitioner, who applies himself especially to the strict study of facts, taking observation for his principal guide. Despairing of finding truth in the systems, which he has well or ill studied, he renounces every system, setting no value either on books or theories, and gaining all his medical knowledge at the bedside of the patient. This common-sense Medicine, as it has been called, reckons amongst its adepts men distinguished for their learning. Less rigid than the Empirics of antiquity, they bestow some attention on sciences from which they pretend

that they are not able to obtain any immediate help. Many of them, no doubt frightened at the apparent or real contradiction of the doctrines, the fictions, and the hypotheses of systems, shelter themselves behind the facts of observation and experience, in a methodical or reasonable empiricism, which is, in fact, nothing more than a commodious means of escape either from Medical pyrrhonism or eclectism."—*Revue des Deux Mondes.*

No. 400.—DR. JOHNSON'S CHAIR.

"The favourite easy chair of my illustrious kinsman, Samuel Johnson, referred to by Mr. Paternoster in *Notes and Queries* July 23, is now (together with the crimson velvet cushion on which Mary Queen of Scots kneeled at her execution) in my possession. I have purchased them of Mr. Paternoster. His fears lest the chair should 'pass into unworthy hands,' were not altogether groundless. It has fallen into mine. I 'would they were worthier.' J. H. SHORTHOUSE, M.D., LL.D. Carshalton."—*Notes and Queries.*

No. 401.—A QUERY AS TO HAY-ASTHMA.

Several English authors, Bostock, Gordon, Elliotson, Prater, King, Mackenzie, etc., have described—under the denominations of summer catarrh, summer bronchitis, hay-fever, or hay-asthma—a catarrh, which, in some persons disposed to it, returns annually, and for the most part, during the whole of life, at the end of May or the beginning of June, lasting some weeks or even two months. The symptoms are mostly coryza with frequent sneezing, inflammation of the conjunctiva of the throat, cough, asthma, slight fever, or similar symptoms.

Occupied with studies on this disease, which occurs also in Germany, France, etc., I would feel highly obliged if English, Scotch, or Irish Physicians would be so kind as to give me notices on the following questions:—

1. Does this disease occur also in Scotland or Ireland? Does it affect natives of these countries, or merely strangers?
2. Does it occur more in towns, or in the country?
3. Does it occur more frequently in those countries where a greater amount of grain is cultivated, or where there is more meadow-land?
4. Is it true that it appears almost exclusively among the higher ranks of society, or has it only been overlooked among the poorer classes?

Any other notices tending to increase our knowledge of the disease, or cases, would extremely oblige me. Even the mere communication of the number of cases, which a colleague has observed, with indication of the sex of the patients, and in what age the disease has firstly appeared, would aid me for a statistical survey.

I offer my sincere thanks beforehand for this trouble, and am ever ready to afford reciprocal services. I will also name gratefully in the preface of a treatise which I shall publish on this affection within about two months, those physicians who will be kind enough to assist me by communications. I beg to that purpose that the honoured colleagues may write their proper names and dwelling-places very legibly.

Letters may be addressed "To the care of Dr. James Hunt, 4, St. Martin's-place, Charing Cross, London."

P. PROEUBUS, M.D.

Professor of Medicine at the Medical Faculty.
Giessen, December, 1859.

ANSWERS.

No. 389.—MARAT AS A SCIENTIFIC AUTHOR.

Marat, who was a Doctor of Medicine, and Physician to the *gardes du corps* of the Comte d'Artois, afterwards Charles X., before he adopted revolutionary politics, was the author of several scientific works, which in their day had some repute. Some of these treated of certain discoveries in light and electricity, and Newton's "Optics" had him for its translator. His work of greatest importance was published in French at Amsterdam, and in English, in London, in 1773, bearing the title, "A Philosophical Essay on Man; being an attempt to investigate the Principles and Laws of the Reciprocal Influence of the Soul on the Body." A copy is in the library of the Royal College of Surgeons. J. C.

M. BROWN-SÉQUARD announces that he has distinctly observed the existence of epileptiform seizures in many of the young guinea-pigs which were produced by parents who had been rendered epileptic artificially by him.

SATURDAY, DECEMBER 24.

CLAUDE BERNARD'S LECTURES.

IN the first number of our first volume for 1860, we shall commence the publication of a Course of Lectures by M. CLAUDE BERNARD, on

EXPERIMENTAL PATHOLOGY AND OPERATIVE PHYSIOLOGY.

Everyone will, we are certain, be gratified to see in an English dress a course of Lectures by this distinguished Physiologist. His name is familiar to all of us; and the reason is, that there is scarcely any part of the deeply interesting study of the laws of life and of organization which has not been investigated by M. Bernard. He has especially investigated the functions of the body in the direction which has rendered his studies particularly valuable to the Practitioner of Medicine; and has thus demonstrated how clearly and distinctly connected is the practice of our Art with a knowledge of the laws of life. His labours teach us that it is impossible for anyone to study successfully the pathological physiology of the human body who has not made himself acquainted with its normal and healthy physiological actions. To understand and value—to a useful end, and as Medical men—a perverted action or function of the animal economy, we must first have made ourselves masters of its natural processes.

Certainly, we may say, that no living physiologist has done more than M. Bernard in thus giving to Medicine its proper and scientific direction. If we were to run through the history of his most numerous experiments, we should find at every step how usefully his investigations have subserved the purposes of the practical Physician. And if his discoveries and the results of his experiments have not taught us the *essence* of diseases, still they have shown us how to avoid numerous errors of the past, and have cleared the way most materially for the path of the future discoverer. For example, his discovery of the glucogenic power of the liver (whether it does or does not maintain its ground as a positive fact in physiology) has totally altered the ideas which previously were held by the Profession concerning the nature and treatment of diabetes. So, again, his experiments on the Pancreas and Salivary Glands, have certainly altered our notions and practice in reference to the treatment of certain diseases of the digestive organs. There is, indeed, no part of the lengthy and complicated process which is comprised under the term Digestion, upon which the researches of this gentleman have not thrown light and illustration. And it is, perhaps, chiefly to this portion of his works that attention has been mostly directed in this country. We shall find, however, that into the recondite and mysterious region of the Nervous System, M. Bernard has also opened a path of his own—developing, if not discovering, some most interesting

natural laws of the nervous forces. There are, indeed, scarcely any of the great regions of Animal Physiology, which have not been visited, and usefully cultivated by this industrious philosopher; and it is for the purpose of bringing before our own countrymen all that M. Bernard has thus so well drawn, and from a conviction of the great practical utility of his investigations, of their immediate bearing on the daily practice of Medicine—the treatment of disease—that we are about to publish the Course of Lectures he will deliver during the present Winter Session, on Experimental Pathology and Operative Physiology. In order to ensure the greatest accuracy, M. Bernard has afforded us every assistance in obtaining correct reports of the Lectures, and has promised to revise the reports himself, so that they will appear in this Journal authorised by himself, as accurate accounts of his views and researches.

THE MEDICAL ACT AND SPECIAL DIPLOMAS.

THE Medical Council, and the Profession generally, are beginning to feel that certain difficulties attend the working of the Medical Act which few persons were clear-sighted enough to foresee at the outset, and which now that they are forced upon the attention by the gradual development of events, do not admit of easy remedy. The discussions in our columns, and in those of our contemporaries, have borne witness to the diversity of opinion entertained on knotty points undetermined by the wording of the Act; and the Medical Council, perhaps wisely, declares in reference to these disputes, that its function is strictly confined by law to carrying out the purposes of the Act, and that it is not endowed, as some seem to suppose, with the powers of a legal tribunal, to decide upon points of law. Among the topics which have given rise to warm debate, and which have been attended with some demonstration of feeling, is the question as to who has the right to call himself "Doctor." A matter of more importance, however, inasmuch as it affects the interests of a larger portion of the Profession, seems to have received less attention; and yet it is probable that ere long it will be felt to be of the greatest moment to have it definitively settled. We allude to the question involved in Clause XXXI. of the Medical Act, which runs as follows:—"Every person registered under this Act shall be entitled, according to his qualification or qualifications, to practise Medicine or Surgery, or Medicine and Surgery, as the case may be, in any part of her Majesty's dominions," etc.

What, it may be asked,—and is already beginning to be asked,—is the meaning of the phrase, "according to his qualification or qualifications"? Can a University Medical Graduate, for instance, claim fees for Surgical attendance, or to be able to do so must he necessarily join a College of Surgeons? To charge for medicines, must he willingly or unwillingly join the Society of Apothecaries? and to recover fees for an obstetric attendance, does the Act compel him to possess himself of a Midwifery diploma? The construction put upon the Clause has hitherto varied with the idiosyncrasy of the person reading it, and according as his sympathies have been enlisted in one or other direction. Some persons hold the literal meaning of the Clause to be, that every Practitioner must possess a diploma distinctly specifying his qualification for that branch of Medical art which he seeks to practise. Others, professing to look not only to the wording of the Act, but also to its spirit and intention, believe Clause XXXI. may be interpreted to mean, that whatever subjects a candidate has been educated for, and carefully examined in, he may legally practise. Thus, although a Doctor in Medicine simply holds a diploma authorising him to practise Medicine, yet Medicine is a generic term; and since a candidate for the degree has been examined equally in Medicine, Surgery, and

Midwifery, he is entitled to practise all these branches of the healing art, which constitute his qualification or qualifications.

We cannot pretend to judge between these opinions, and we much question if the Medical Council feels competent to decide the matter. Strictly speaking, it can be settled only by a decision in the courts of law, or by some amendment of the Medical Act. There is thus much reason to complain of the dilemma in which such ambiguous language places the Medical Practitioner. He is uncertain whether the qualifications he possesses are sufficient for the purposes of his practice; and the future aspirant to the honours of the Profession, in his efforts to secure the most serviceable qualification, and the one which will confer upon him the most extensive privileges, finds a "confusion worse confounded." In reviewing these difficulties, we are thrown back upon the conviction, freely expressed in this Journal during "the Battle of the Bills," that the simplest scheme for meeting all the difficulties besetting the path of Medical legislation, would have been to establish a uniform State-examination for all grades of the Profession, which should have embraced all Medical subjects; and, having taken this guarantee of the capacity of candidates, they should have been entitled to registration, and might safely have been left to join any College subsequently, according to their predilections. The present Act was drawn up as a concession to the existing examining bodies; yet, as might have been anticipated, it failed to please, and at last passed in spite of them. The Select Committee's Bill was most in unison with the principles of sound legislation, and would scarcely have interfered with the welfare of Universities or Royal Colleges, while it would have secured uniformity of education, at least up to a certain point, and created none of the cavils and disputes which have arisen out of the cumbrous machinery of the present Act.

Meanwhile, every inducement is held out to the examining bodies to multiply the number of qualifications and diplomas. An examination in a special department, and the after presentation of a diploma, of course implies the payment of an additional fee, and increases the revenues of the College adopting it. Thus the corporate bodies gain an advantage at the expense of the commonwealth. The ambiguous wording of Clause XXXI., and the many-sided interpretations it admits of, directly foster this multiplication of qualifications; and it is manifestly the interest of bodies conferring special diplomas to construe the Act as rendering these essential to the legal practice of the branch specified. We understand that the late Solicitor-General, Sir Hugh Cairns, when referred to in a dispute between the Dublin Colleges of Physicians and Surgeons and the Medical Council, as to whether it was lawful to insert the Dublin Midwifery licence in the Medical Register (the Dublin licence not being in Schedule A. of the Medical Act), gave it as his decided opinion that the Council were bound to register any qualification bestowed by the bodies named in Schedule A., if they could establish a legal claim to confer such qualification, whether it appears in the Schedule or not. Should the accuracy of this opinion be confirmed, we may have this or that College laying claim to confer special diplomas, and to have them inserted on the Register, until we are deluged with partial qualifications, and until the mere fact of a person being registered is no proof of his having undergone any sound and general education at all.

The institution of a special licence in Midwifery is looked upon with unfeigned regret by many who take a deep interest in the progress of Medical education. Not only does it subject candidates who imagine it may be an advantage to possess a Midwifery diploma to the inconvenience of a separate examination, and the payment of an additional fee apart from that required for the membership, but indirectly it connives at partial and imperfect Medical education. Indeed, every examination which does not embrace all the practical

branches of Medicine, Surgery, and Midwifery, may be charged with this. It is well known, for instance, that candidates for the membership of the College of Surgeons, are examined exclusively on Anatomy, Physiology, and Surgery. Yet the diploma for membership qualifies for registration under the Medical Act; and numbers of men have rested satisfied, and probably will rest satisfied in future, with the single qualification, undertaking all the responsibilities of general practice without having submitted to any examination in Medicine and Midwifery whatever. True it may be urged that no one can sue for Medical attendance and Medicines without a Medical qualification, but who shall draw the line between Medicine and Surgery? There are ways and means of meeting such difficulties; once upon the Register, the Practitioner is in a measure safe, and the Medical Council and Colleges may depend upon it that the contradictions involved in Clauses XXXI. and XXXIV. will be turned to account; for while the former states that "every person registered shall be entitled to practise according to his qualifications," the latter most explicitly affirms that "the word legally-qualified Medical Practitioner, or duly qualified Medical Practitioner, etc., shall be construed to mean a person registered under this Act."

But the Midwifery licence of the College of Surgeons is considered by some of the most eminent Obstetrical Practitioners to be particularly obnoxious. The Council of the Obstetrical Society, in a memorial to the General Medical Council, has expressed its disapproval in forcible and distinct terms. The memorial says:—"This special licence in Midwifery is derogatory to the position of the Obstetric Practitioner, as tending to revive his supposed inferiority to the Practitioner of Medicine and Surgery, which inferiority it has been the province of progressive science to remove. The social effect of the Midwifery licence is felt the more severely, since it has been proposed by the College of Surgeons to institute a special licence in Dentistry, with which it would in future be associated as apart from regular Medical qualifications." Then it is further shown that the possession of the Midwifery licence being entirely voluntary and apart from the membership, any member of the College may practise Midwifery without having passed any examination on the subject. Moreover, it appears that the Midwifery licence may be granted to persons not members of the College, or to those who have no other qualification whatever, and the possessor of a Midwifery diploma has a distinct title to appear on the register as a Medical Practitioner. That as yet no such persons have been found competent to pass is nothing to the purpose; the very existence of such a regulation is a disgrace alike to the College and the Profession; and gives rise to a suspicion that it is one of those back-doors kept as a convenience to certain persons whom it may answer the purpose of the College to admit within its portals.

What the College of Surgeons can have to do with the examination of Dentists passes our comprehension. That Dentists may possibly be better for a Surgical examination, we do not deny; but Dentistry is essentially a mechanical art, with which Surgeons are not conversant, and the Odontological Society and College of Dentists are much more competent to test the qualifications of Dentists than any College of Surgeons. The contemplated admission of Dentists to the College has produced great discontent among the members, and it seems evident that in the face of this, no pecuniary advantage promised to the College should have induced it to accede to such a proposal. There is no necessity for the College of Surgeons to make use of the power conferred by the forty-eighth clause of the Medical Act, and the sooner it gives up the idea of doing so the better. These piece-meal examinations remind one forcibly of Dutch auctions, and place the bodies which adopt them altogether in

an inferior position, which the public cannot fail eventually to discover. Properly they can only be allowable for the higher grades of the Profession, and for those who have already given evidence of general qualifications; as a means of getting admission to the Register they are faulty in the extreme, and deserve reprobation. Let the members of the Profession by all means use their influence to have Midwifery incorporated in the general examination, and allow the Dentists to manage their own affairs.

THE WEEK.

WE regret to announce the death of Dr. Montgomery, the eminent ex-Professor of Midwifery in the King and Queen's College of Physicians in Ireland. Dr. Montgomery expired at his residence in Merrion-square, Dublin, on Wednesday morning, the 21st inst. We shall next week give a short biographical sketch of this distinguished Physician.

In another column will be found an abstract of the Report of the Diphtheria Sub-Committee of the Epidemiological Society. A series of questions was extensively circulated, asking for replies as to matters of fact. After ten months just *thirteen* (!) reports were received in accordance with the circular, and twenty-three general replies. Most of those gentlemen who made excuses explained that they had not made a note as to the facts required at the time of their occurrence. Men in active practice are too busy for accurate note-taking; but, surely, if our Societies would follow the example of the Epidemiological, and extensively circulate memorandums suggestive of the direction of an inquiry upon subjects of interest which require the efforts of numerous scattered observers, the Profession generally would be moulded into the habit of combined and concentrated observation.

Death in the Pot is still daily awaiting us in this favoured Isle. We are told by the *Times* that the trade of this country is becoming notorious for great and disgraceful sophistications; and true it is, that almost everything which we eat and drink is tainted, falsified, and poisoned. Here is a new style,—chromate of lead in buns to save eggs!

"A case occurred at Clifton, on Friday, which might have been attended with fatal consequences had not prompt measures been taken to counteract the effects of some poisonous matter used in the composition of Bath buns, and which nearly cost the lives of six young gentlemen, pupils in one of the first boarding-schools in the place. The circumstances of the case were as follow:—Three of the youths had been walking at Redland, and purchased some Bath buns at the shop of a confectioner named Farr. In the course of the afternoon three other lads from the school went to the same place and bought some more buns. In the evening all six were seized with violent sickness, and presented the symptoms of having partaken of some poisonous substance. Mr. Cross, Surgeon, of Clifton, was called in, and prescribed the necessary remedies, but the patients continued so ill during the night that two of them were not expected to survive. Fortunately, however, but after great suffering, they all recovered. Some of the buns which had not been consumed were subjected to analysis, when it was found that each of them contained seven grains of chromate of lead, which was used as a cheap substitute for eggs, for the purpose of colouring the buns."

In all prosecutions under the Medical Act it should be remembered that the only ground on which a conviction can be obtained, is proof that the accused has falsely pretended to possess a Medical title. A penalty is imposed for obtaining registration by false pretences, or for wilfully and falsely pretending, 1. To be, or take, or use the name or title of a Physician, Doctor of Medicine, Licentiate in Medicine and Surgery, Bachelor of Medicine, Surgeon,

General Practitioner, or Apothecary. 2. To take or use any name, title, addition, or description implying that he is registered under the Act. 3. To take or use any name, &c., implying that he is recognised by law as a Physician or Surgeon, or Licentiate in Medicine and Surgery, or an Apothecary. The question comes "Who is to prosecute?" The General Council refuse, and the duty has devolved in England upon the Registration Associations. It was supposed that in Scotland and Ireland that duty would devolve upon the public prosecutor; but we now learn from the *Daily Scotsman* that as the Act declares the penalties may be recovered "in Scotland by the Procurator-Fiscal of the country, or by any other person," and as in all cases where Acts of Parliament provide that prosecutions may be undertaken by the Procurator-Fiscal, "or by any other person," that functionary is instructed not to prosecute; he will not institute prosecutions under the Medical Act. On receiving this information, a deputation of the Scottish Branch of the Medical Council waited on the Lord Advocate, to ascertain whether any modification of this rule could be obtained. The reply they received was unfavourable, and there the matter terminated. Under these circumstances, if the penal clauses of the Act are to be enforced at all in Scotland, the Medical Practitioners in that country must follow the example of their brethren in England, and form Registration Associations in Scotland. We understand that a movement in this direction has already commenced, both in Edinburgh and Glasgow, and that almost all the leading Practitioners in both cities have expressed their willingness to assist in furnishing the funds required for the prosecution of flagrant offences under the Act. We wish them every success, and trust that the Public will aid the subscription-list, as they are far more interested than the Profession in being protected from pseudo-Medical impostors.

M. Babinet asserts that rivers are made to deviate in some degree from their straight course by the rotation of the earth. The points of the surface of the earth revolve more rapidly near the equator than at the pole. Now the molecules of a stream running from north to south in one hemisphere, like the Rhone, are continually meeting with the banks which have a rotation towards the east, a rotation which is most rapid at the mouth of the stream. But the contrary occurs in streams running from south to north. The Nile, for instance, has a rotation less at its mouth than at its source. So that both in the Nile and Rhone the right bank of streams ought to be worn away; and that of the Nile should be deposited on the Palestine side, and those of the Rhone on the Spain side. And this is, according to Babinet, what happens. In the Rhone the bed of the river revolves more rapidly than the water, whilst in the Nile the water revolves more rapidly than its bed.

The following remarks, made by the *Gazette Medicale* apropos of a famous trial, are worthy noting:—

"Our *confrères* over the water are justly occupied with a consideration of the scandal offered every assizes by the organised struggle which takes place between the accusation and the defence. The prosecution produces an *expert*, and immediately the defence replies by producing another; then the first brings another champion to his help—one, two, three reinforcements; and just the same does the defence. Sometimes, thus, we find ten on one side, and seven on the other, and all of them obliged by custom and passion to devour each other scientifically. One can readily understand how the opinion of such scientific men—reduced to the position of suspected witnesses—must lose in authority and respect, debating a question which may be controverted, and in reference to which law and usage assign them the character of advocate, and not of judge, which they ought to hold. The English Medical press is unanimous in calling for

a reform in this matter; and this time our neighbours may, without reservation, point to the French system as a desirable introduction among them. But how long an abuse may cry out before anyone will listen! long enough every way, indeed! but in England for ever."

Colica Pictorum—the colic of Poitou, say our classical authorities. In defence of such an origin of the term, we find in the *Union Médicale* a paper by M. Gouriet, who details cases of poisoning by lead in Poitou. The peasants ferment their grapes in earthen vessels, which are glazed with a leaden preparation; acetate of lead is formed, and then they who drink the liquid catch a colic. Snuff-takers, we may add, also occasionally take a lead-colic *via* their nose. The snuff, it appears, after long keeping, corrodes the lead in which it is enclosed. Hence, M. Chevallier recommends that the snuff should be folded up in gutta percha.

Our attention has been recently directed to a case of drowning, in which the coroner and jury agreed that a Medical man who was called to the case and attempted to restore suspended animation, ought to be remunerated for his attention. The newspaper report says:—

"The learned Coroner said that if it was the wish of the jury he would send for Mr. Higgins. For his evidence, one guinea would have to be paid, which of course would come out of their rates. He (the Coroner) had no wish not to call the surgeon; but in his official capacity he considered, after the length of time, three quarters of an hour, the deceased had been in the water, Mr. Higgins could not assist them in coming to a conclusion.

"Another jurymen said there could be no doubt that the learned Coroner had acted according to the law, but he considered that Mr. Higgins ought to get some remuneration for his trouble.

"The Coroner said that the father would be liable to pay Mr. Higgins if he was able to pay; but if not, the overseers of the parish were liable. On the other hand, he was perfectly willing, with the concurrence of the jury, to send for that gentleman.

"The jury having expressed a wish that Mr. Higgins should be sent for, the Coroner's officer was despatched to obtain his attendance, and he arrived in a few minutes, but merely stated that he was called to see the deceased, and, after using artificial respiration, found there was no hope of recovering the unfortunate man.

"A jurymen said that many such accidents occurred almost daily, and if Medical men were not remunerated in some way, they would very likely not attend when called upon.

"The Coroner said his only wish was to give satisfaction to the jury, and if they considered that any good would hereafter ensue from the Medical gentleman being sent for, he could only express his gratification that it had been done, for if they erred it was certainly on the right side."

We have been requested upon this statement to give an opinion whether in cases of drowning and other street accidents, the parish overseers are liable for the Medical expenses. Knowing this to be rather a question of law than of justice, we submitted it to a legal friend, who has favoured us with the following opinion:—

"Doubtless the Coroner has the power of ordering the attendance of Medical men, who may be called upon to act in cases of accidental death, and to award the usual remuneration allowed to all Medical witnesses. But unless death ensue, this mode of compensation cannot be exercised. No doubt, the Medical attendant at an accident may, by subsequent services rendered to his patient, recover his fees for this attendance, as the law would imply a promise of payment; but unless such a state of circumstances should arise, no remuneration can be enforced."

ANOTHER death from Chloroform has been announced in the journals as occurring at La Charité in the practice of M. Manec.

QUESTIONS AT THE WRITTEN EXAMINATION FOR HER MAJESTY'S INDIAN MEDICAL SERVICE.

DECEMBER, 1859.

IN determining the relative merits of the candidates, so far as they can be ascertained from answers to printed questions, regard will be had both to the number of questions answered and to the accuracy and completeness of each answer. But it is not expected that all the questions will be fully answered by every candidate. For they are not only intended for ascertaining whether each candidate is qualified for an appointment, but for testing, by both their number and their difficulty, the relative abilities of the best candidates,—a design which is essential to a competitive examination, and which cannot be fulfilled unless some questions are asked to which only the best candidates can give good and complete answers.

NATURAL HISTORY.

Monday, December 12, 1859.—10 to 1 o'clock.

DR. HOOKER.

ANSWER FIVE OR MORE OF THE FOLLOWING QUESTIONS.

1. Enumerate the vegetable anthelmintics, their scientific names, natural orders, and the countries whence they are obtained.
2. What are the principal substitutes for tea? Give their respective qualities and properties.
3. Enumerate the principal plants from which fermented drinks are prepared in various parts of the world.
4. What are the medical properties of the officinal plants in the natural order Compositæ? Give their names, and the tribes to which they belong.
5. What are the chief modifications of the flowers of grasses?
6. What natural orders of plants are characterised by an irregular monopetalous corona with two to four epipetalous stamens?
7. Enumerate the integuments and contents of a dicotyledonous seed; and describe the process of germination.
8. What is meant by rotation of crops? and upon what physiological principles is it based?
9. What are the tribes of the class Aves? and how do they differ in structure and habits?
10. Describe the poison-apparatus of the adder, bee, wasp, and scorpion, and their mode of action.
11. Enumerate the orders of Mollusca, giving an example of each.
12. What is chalk, chemically, structurally, and geologically?
13. Define tersely and accurately the terms fracture, articulation, intussusception, introversion, extrusion, adnate, polyhedral, elliptical, parabolic,—giving the derivation of each.
14. Give briefly the character and properties of proteine, fibrine, gluten, starch, caseine, elaine, stearine, and legumine.
15. What gases are given off from urinals and water-closets? and how should the evils dependent on them be avoided in Hospitals?

SURGERY.

Monday, December 12, 1859.—2 to 5 o'clock.

MR. PAGET.

1. Describe the states named respectively "Shock" and "Reaction," as seen in such a case as that of a crushed limb.
2. Enumerate the chief varieties of inflammation of the testicle; and state the distinctive characters of each.
3. Give an account of secondary hæmorrhages, such as may occur after amputation, and of the best modes of treating them.
4. What ill consequences may follow dissection-wounds? and what are the best means of treatment, preventive, and curative?
5. What are the chief means by which, in the reduction of herniæ, the "Taxis" may be assisted? and in what conditions is each of them most useful?

6. Describe the process of repair of a tendon after subcutaneous section.

7. Describe the several diseases of the eye that are connected with syphilis and gonorrhoea.

8. A man, fifty-three years old, while under treatment for slight stricture of the urethra, was exposed to cold damp weather, and next day had a severe rigor, followed by heat and sweating, and completely lost the power of passing urine. On each of the next two days he had similar rigors; and on the third day he was not only still unable to pass urine, but had constant straining and extreme pain in his attempts to do so. During three days more, these symptoms continued, with rigors; and there were gradually added to them, pain in the perineum and about the anus, tenderness on deep pressure in front of the anus, and heavy forcing pain referred to the lower part of the rectum. The bladder was regularly emptied with a catheter, and was not painful on pressure; the urine was generally healthy. What would you suspect to be the disease in this case? and how would you prove and treat it?

ANATOMY AND PHYSIOLOGY.

Tuesday, December 13, 1859.—10 to 1 o'clock.

MR. BUSK.

1. Give a general description of the spinal column, and of the course of its ossification.

2. Describe the mode of development of a vertebra in general, indicating the exceptional cases (exclusive of the sacrum and coccyx).

3. Enumerate the various muscles, and describe their respective actions by which the deformity witnessed in the following fractures is probably caused:—

(1) Fracture of the neck of the femur.

(2) Fracture of the lower end of the femur immediately above the condyles.

(3) Fracture of the lower end of the radius (Colles's fracture).

4. Describe the arch of the aorta, the relations of its various portions, and the dissection necessary to examine it; mention also the principal variations in the position of its branches.

5. Describe the parts contained in the space bounded in front by the posterior border of the sterno-mastoid, behind by the anterior border of the trapezius, and below by the clavicle.

6. Give a general account of the lymphatic and lacteal system, including the minute structure of the lymphatic vessels and glands.

7. Describe the physiological effects of the division of the vagi nerves.

8. Mention the parts in other vertebrate animals which are homologous with the human hand, or parts of it.

MEDICINE.

Tuesday, December 13, 1859.—2 to 5 o'clock.

DR. PARKES.

1. Describe the symptoms and post-mortem appearances of tubercular meningitis in children under five years of age.

2. Describe the alterations to which the cerebral arteries are liable; and state the possible consequences of such alterations.

3. What is the treatment of extensive double capillary bronchitis in children and adults?

4. What are the symptoms, anatomical appearances, and treatment of cirrhosis of the liver?

5. A woman, aged 56, was admitted into Hospital with great oedema of the face and the upper extremities, and with immense turgescence of the cervical veins. The body and legs were entirely free from anasarca, and there was no evidence of renal disease. The heart's sounds were feeble but without murmur. There was very decided dulness, with slight pulsation, without murmur, under the first bone of the sternum. The pulsations of the radial arteries were equal in both wrists.

Comment on these symptoms, and state what diseases would afford a reasonable explanation of them. Mention also any symptoms (not given above) which you suppose may have been present.

6. Describe the various forms of polypus of the uterus, their diagnosis and treatment.

REVIEWS.

The Nature and Treatment of Gout and Rheumatic Gout. By A. B. GARROD, M.D., F.R.S. London: 1859. 8vo. Pp. 601.

Dr. Garrod's name will ever fill an honourable page in the history of Medicine as the demonstrator of the fact—only surmised before his researches—that the blood of gouty patients is contaminated by an abnormal amount of uric acid. Other contributions of less, though considerable, importance which he has made to our knowledge of the morbid anatomy and pathology of gout, and has brought forward at different times before the Royal Medical and Chirurgical Society have prepared the Profession to look forward with some impatience to the work now before us, which embodies, in an extended and connected form, the results of "a series of investigations on Gout and Rheumatism carried on for the last twelve years."

Our space does not permit us to enter upon anything like a critical analysis of so important a work; and we must be content with pointing out to our readers the subjects of the greatest interest in its successive chapters.

The first chapter contains some Introductory Remarks as to the knowledge of gout possessed by ancient writers. These need not detain us. The classification of the varieties of gout adopted by different authors is then considered; the author adopting the simple divisions of 1. Regular, including acute and chronic; and 2. Irregular.

In the second chapter an attack of Acute Gout is described. This we can also pass over as the author adds little or nothing to the descriptions of previous writers; indeed his account falls far short of Watson's in graphic power, and of the oft-quoted classical picture of Sydenham.

In the chapter on Chronic Gout the author adds to the account of previous observers a very correct description of the microscopical appearance and chemical characters of the whitish chalk-like deposits, which are truly pathognomonic of the disease, confirming the belief long entertained that urate of soda is the most essential substance in the composition of these deposits. He also gives us a newer and more original addition to our knowledge in the following observations respecting gouty deposits upon the cartilage of the ears. He says:—

"In one or two works it is mentioned that small concretions are now and then seen even upon the cartilages of the ears, but no particular notice is taken of the fact. Within the last few years I have specially investigated this point, and find that instead of such deposits being occasionally present on the ear, they are more frequently found there than in any other situation; and that where they are visible upon any other part, they are usually, but not invariably, seen on the ears also.

"In thirty-seven gouty patients who were examined to ascertain the presence or absence of concretions of urate of soda upon the surface, or in such situations as to be undoubtedly recognised, it was noted that they were present in seventeen cases, absent in twenty; and in the above seventeen they occurred in the ears alone in seven cases, in the ears and around the joints in nine, and in one case only could they be recognised in other parts of the body, without being present in the ears also.

"In the ears they vary much both in number and size, sometimes only one exists, at others as many as eight or ten; in size they occasionally equal a split pea, often they are not larger than a pin's head, and now and then even much less, a mere point only. They have the appearance of little pearls, and are generally situated about the fold of the helix; sometimes they possess a gritty hardness, but often are soft, and when punctured give exit to a milky or cream-like fluid. Further examination shows that when hardened they become firmly attached to the cartilage of the ear, and enlarged blood-vessels are often seen in their neighbourhood, and extending some distance from them."

The fourth chapter is on the "Blood in Gout," and is one which will especially attract the reader. The altered condition assumed by previous writers was first defined and demonstrated by Dr. Garrod. In 1847 he made observations which were brought before the Medico-Chirurgical Society in 1848,

and the following conclusion drawn—"The blood in gout always contains uric acid in the form of urate of soda, which salt can be obtained from it in a crystalline state." The author says he is now disposed to "append the words, 'in abnormal quantities,' as I have found that in health the merest traces both of uric acid and urea can usually be detected by very great care in manipulation."—Page 109. The process now adopted by the author is so simple that it can be employed by any Medical man. He has named it the "Uric Acid Thread Experiment," and we quote his own account of how it is performed:—

"Take from one to two fluid-drachms of the serum of blood, and put it into a flattened glass dish or capsule; those I prefer are about three inches in diameter, and one-third of an inch in depth, which can be readily procured at any glass-house; to this add ordinary strong acetic acid, in the proportion of six minims to each fluid-drachm of serum, which usually causes the evolution of a few bubbles of gas. When the fluids are well mixed, introduce a very fine thread, consisting of from one to three ultimate fibres, about an inch in length, from a piece of unwashed huckaback or other linen fabric, which should be depressed by means of a small rod, as a probe or point of a pencil. The glass should then be put aside in a moderately warm place, until the serum is quite set and almost dry; the mantel-piece in a room of the ordinary temperature, or a book-case, answers very well, the time varying from twenty-four to forty-eight hours, depending on the warmth and dryness of the atmosphere.

"Should uric acid be present in the serum in quantities above a certain small amount noticed below, it will crystallise, and during its crystallisation will be attracted to the thread, and assume forms not unlike that presented by sugar-candy upon a string."

Dr. Garrod appends notes of several precautions which must be observed to secure perfect success in this experiment, and then goes on to show that—

"An amount of uric acid, equal to at least 0.025 grain in the 1000 grains of serum, in addition to the trace existing in health, is required before the 'thread experiment' gives indication of its presence, and hence the appearance of uric acid on the thread is complete evidence of an abnormal or morbid quantity in the blood. In several experiments on the blood in gout and albuminuria, where quantitative determinations were made, the amount of uric acid in the 1000 grains of serum was found to vary from 0.045 to 0.175 grain."

Some very interesting facts are then related upon a matter which requires much further investigation; the strong probability, however, being made out, that "oxalic acid is formed in the animal body, not, as formerly supposed, from the oxidation of saccharine matters, but from the decomposition of uric acid."—Page 117. Dr. Garrod seems to regard this as new; but Liebig and Wöhler made out the main fact long ago.

Another of Dr. Garrod's discoveries was made known in 1854. He showed, as one might expect, that when the blood is rich in uric acid, the secretions from the blood also contain the acid. This led to his finding it in the serum effused beneath the cuticle after the application of a blister, and to the curious observation that—

"The application of the blister should not be made to an inflamed surface, for the existence of inflammation, at least of a gouty character, has the power of destroying the uric acid in the blood of the part, and hence prevents its appearance in the serum."

The facts that an excess of urea is present in the blood in many cases of gout, and that oxalic acid is frequently detected in it, are suggestive of further inquiries. Dr. Garrod questions the accuracy of previous statements as to the presence of urate of soda in the perspiration of gouty patients. He has found oxalate of lime in it, but he says:—

"Considering the nature of the excretion from the skin, it would hardly seem probable that a body possessing the properties of uric acid should be thrown out with it, either in its free state, or in the form of a salt. I could easily imagine that the fluid from eczema, or, in fact, from any other cutaneous eruption, when occurring in patients whose blood is rich in uric acid, would contain this principle, because such secretions are alkaline, and bear a close resemblance to the serum effused by the application of a blister."

We have given up so much space to this important chapter, that we can only offer the above extracts as a sample of the valuable information contained in the following chapters on "Urine in Gout," "The Morbid Anatomy of Gout," "The Causes of Gout," "The Pathology or Nature of Gout," "The Treatment of Gout," "Irregular Forms of Gout," and "Rheumatic Gout." There are many points in these chapters which well deserve discussion. With regard to the last chapter we may explain that the author seems to have been driven to the use of a term he has objected to when used by others. He admits that the term "Rheumatic Gout" is not inappropriate if we agree to name a disease simply from its external characters; but if we "have regard to more intimate pathology, then," he adds, "I deny the propriety of the name," and suggests *Rheumatoid Arthritis*, as implying "an inflammatory affection of the joints, not unlike rheumatism in some of its characters, but differing materially from it."

We have now simply to perform the grateful task of recommending this work most heartily to our readers.

PROGRESS OF MEDICAL SCIENCE.

Selections from Foreign Journals.

ON THE INFLUENCE OF SEX ON THE DISEASES OF CHILDREN.

By Dr. R. KÜTTNER.

THE materials for this essay are derived from the consideration of 10,000 cases of disease, which have been observed at the Children's Hospital at Dresden. The following are the conclusions Dr. Küttner arrives at.

1. Male infants are far more frequently, and especially during the first year, the subjects of disease of the digestive organs than female infants. It is a well-known fact that they are more difficult to bring up by hand, being much more liable to have the digestive apparatus disordered by defective or erroneous diet. In a relatively equal mortality of the two sexes, a much absolutely greater number of males die of this class of diseases.
2. So also diseases of the nervous system, particularly brain affections, and especially within the five first years of life, are almost twice as frequent in boys as in girls.
3. Finally, boys are far more disposed to hernia (of 116 cases, 75 occurred in them) than girls, and that with regard to both umbilical and inguinal hernia.
4. On the other hand, girls suffer more than boys from affections of the respiratory organs, especially catarrhal affections; for while the former presented 1128 cases, the latter presented but 988. But the difference becomes especially obvious during the fifth year; as the difference, insignificant (873 girls 843 boys) prior to that age, then mounted up to 255 as compared to 145. Of 498 cases of pertussis, 281 occurred in girls and 217 in boys. Of 17 cases of croup, 9 occurred in boys, and 8 in girls.
5. In organic disease of the heart, a preponderance of females existed, viz. 13 out of 19 cases.
6. In acute blood-diseases, as exanthematous and typhus fevers, sex seems to exert no influence; but such influence is remarkable in the chronic blood-diseases and dyscrasies, especially in anæmia, and scorbutus-like depravation of the blood. Of 144 cases of this class of disease, only 26 occurred in males, and 118 in females. The difference becomes more marked with the advance of life: for while under 7 years of age, 17 boys and 30 girls belonged to this group, between the years of 8 and 13, there were but 8 boys to 88 girls. Scrofula and tubercle exhibited themselves in the proportion of 305 in girls to 269 in boys. Until the course of the second year, there was a preponderance in the males (86 boys to 69 girls); but after the fifth year there were, owing to the greater frequency of pulmonary phthisis among them, 121 girls to 72 boys. Rickets were observed in 577 boys and 610 girls, the disease being later developed and more enduring in girls than in boys. Congenital syphilis was observed in 36 boys and 49 girls.
7. Chronic diseases of the skin occurred in 903 of the 10,000 cases of disease; but no marked difference from sex was observed prior to the ninth year, after which period girls were found much oftener subject (88 to 31), and especially to diseases of the scalp, than boys.
8. Enlarged thyroid gland was met with in 15 male and 35 female children,—25 of the

latter having passed the ninth year.—*Journal für Kinderk*, Band xxxii. p. 11.

ON ANGINA PHARYNGEA OEDEMATOSA IN CHILDREN.

By Dr. WERTHEIMER.

Dr. Wertheimer desires to call attention to a variety of common angina, characterised by serous infiltration of the submucous tissue of the pharynx. The four cases which he has met with occurred in children of the respective ages of seven weeks, three months, eighteen weeks, and ten months. In all of these difficult and "rattling" respiration first calls attention to the malady, and, on examining the throat, large accumulations of loose, foamy mucus are observed attached to the isthmus and pharynx; and on the removal of this, all those parts possessed of a loose submucous tissue, are found to be excessively swollen—especially the uvula and tonsils. The mucous membrane is pale, smooth, and to the touch soft and sticky. The mucous membrane itself, and especially the glandular apparatus, plays the chief part in the affection. The dyspnoea, although considerable, does not become so urgent as in various other affections, such as oedema of the glottis, croup, etc. The respiration is very noisy, and accompanied by an expiratory snoring sound. The voice undergoes some change, and the cry of the child is less clear, but it is never hoarse as in affections of the larynx, or suffocative as in severe inflammatory affections of the lungs. Swallowing and sucking are difficult, but not painful; but the child chokes frequently, and at last refuses all nourishment. There is not usually any fever present. In two of the author's cases the course of the disease was acute (five and nine days), and in the other two, chronic; and they all recovered. The prognosis of the affection is, therefore, favourable; the prolongation of the disturbance of nutrition being the most unfavourable feature.

Oedematous angina is, in many respects, nearly related to catarrhal angina, but is distinguished by the almost suddenness with which exudation takes place, while, besides the tumefaction of the mucous membrane and the accompanying excessive secretion of mucus, there is also deposited a watery exudation, partly on the surface and partly within the cellular substance. From this result the looseness and fluidity of the secretion, and the peculiarly loose kind of intumescence of the structures implicated. This disease, like catarrhal angina, doubtless in some cases requires an active therapeutical agent; but in other cases assistance is called for. Emetics are then especially useful, the author preferring infusion of ipecacuanha with oxymel of squill; and sinapisms applied to the neck for a few minutes are sometimes desirable. When the affection assumes a chronic form, pencilling the parts with a solution of nitrate of silver is of use.—*Ibid.*, Band xxxii. pp. 12—18.

EXCERPTA MINORA.

Employment of Sambucus Nigra in Dropsy.—M. Reysie, a Belgian practitioner, states that he has long employed the juice of the root of the sambucus as an excellent purgative in dropsy. The bark of the fresh root must be detached by scraping, and the juice is extracted from the scrapings by pressure. The dose is a tea-spoonful for an ordinary purgative; but as it does not cause colic or any other inconvenience, the quantity may, in the case of dropsy, be increased to a table-spoonful, which will often induce from twenty to thirty stools. It is a curious fact, that the process of boiling, as in the preparation of a syrup, converts this purgative into a diuretic, which may also be of great use in dropsy.—*Revue Méd.*, November, p. 560.

Borax in Diphtheritis.—M. Leriche, having derived great advantage from the employment of large doses of borax in croup and the various pultaceous affections of the buccal mucous membrane, determined upon giving it in diphtheritis, which was prevailing in his locality. He relates two cases, occurring in adults wherein its employment was quite satisfactory, in one of which twenty-six drachms were given in four days, and in the other fifty drachms in six days.—*Ibid.*, p. 535.

Phosphorus in Paralysis of the Muscles of the Eye.—M. Taignot, in localised paralysis of the muscles of the eye, employs with success the following liniment:—Walnut-oil, 3xxv.; naphtha, 3xiiij.; phosphorus, gr. iij. Frictions are performed in the evening by means of a piece of flannel, this remaining also fastened around the forehead all night.

M. Taignot also administers the following emulsion internally:—Oil of almonds, 3ij.ss.; phosphorus, gr. j.ss.; gum-syrup, 5xxij.ss.; powdered gum, 3½. To be well shaken when administered, the dose being at first one, and then two and three teaspoonfuls per diem.—*Bull. de Thérap.*, tome lvii., p. 456.

Collyrium in the Ophthalmia of New-born Infants.—M. Foucher employs the following collyrium:—Glycerine, 5viij.; nit. of silver, gr. 1½ ad gr. iij. The eye is first washed by injecting a very weak solution of chloride of sodium, and then a drop of the above collyrium is deposited on the internal surface of the eyelids by means of a small camel's-hair pencil.—*Ibid.*, p. 457.

GENERAL CORRESPONDENCE.

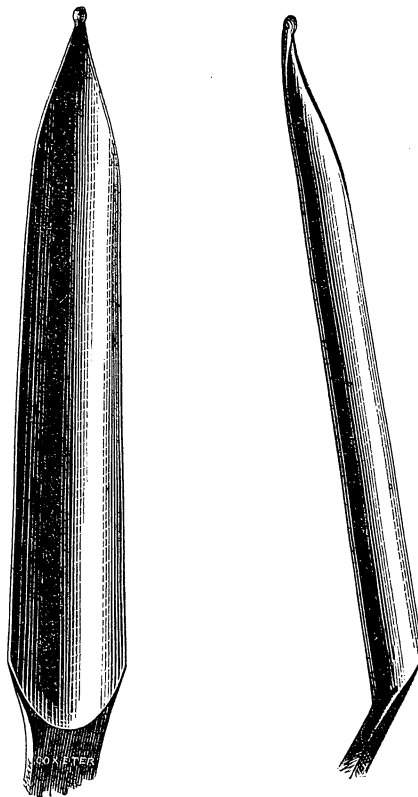

MEDIAN LITHOTOMY.

LETTER FROM MR. HENRY THOMPSON.

[To the Editor of the Medical Times and Gazette.]

SIR,—I am induced to follow up the interesting communications which have appeared in the last two numbers of the *Medical Times* relative to the operation of Median Lithotomy, with a description of an instrument which appeared to facilitate the proceeding in the case of a child, upon whom I performed that operation at University College Hospital on Wednesday last.

The patient was only three and a-half years old; and anticipating, therefore, that without some special means of carrying the finger along the staff from the membranous portion of the urethra into the bladder, considerable difficulty might be encountered, I had a director made for the purpose. The idea was suggested by the director which I have employed in circumstances somewhat similar—viz., for the purpose of facilitating the passing of a large catheter into the bladder after Symes's operation for stricture of the urethra, and figured in my work on "Stricture," Second Edition, p. 295.

In the present case I added a probe point to run along the staff, and made the whole sufficiently wide to meet the

necessity of the case—viz., about half-an-inch at the extreme breadth, but gradually tapering to the probe point aforesaid. The concavity is also considerable, to receive and direct the forefinger. The adjacent figure represents the instrument of the natural size. It now more resembles a gorget, but is taper throughout and thicker, so as to prevent the possibility of its edges cutting the tissues by which it passes.

Having made the incisions strictly in the manner recommended by Mr. Allarton, I introduced the director with the concavity upwards into the groove of the staff, and pushed it gently on into the bladder. I had now no difficulty in sliding the left forefinger along into the cavity and feeling the stone which was then extracted with very little difficulty. It was perfectly spherical and about the size of a marble. The child is doing admirably well. I should say that Mr. Bowman kindly lent me the instrument which was depicted in last week's Journal, and that I should have used it had not the other appeared to accomplish fully the desired object.

Perhaps I may be permitted to add, that when reviewing this subject at length in the Medical and Chirurgical Review four years ago, in connexion with the works of Mr. Allarton and others on lithotomy and lithotrity, I expressed an opinion in favour of the median operation, and a belief that it was well adapted to many cases in which the lateral operation, and to some in which lithotrity were then applied. All I have seen since that time tends to confirm that opinion, and the experience which Mr. Teale has so admirably expounded in his recent paper, must be considered as most important evidence in behalf of median lithotomy, and to warrant the increasing favour with which it appears to be regarded by many members of the Profession.

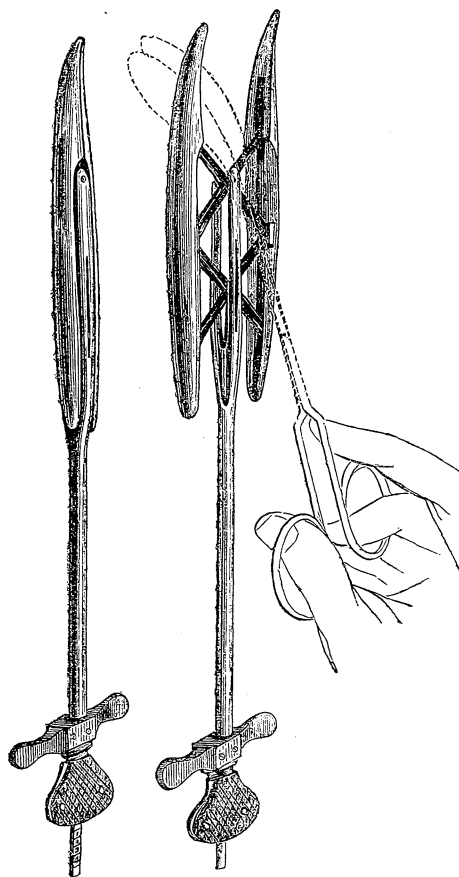

I am, &c. HENRY THOMPSON.

LETTER FROM MR. ARMSTRONG TODD.

[To the Editor of the Medical Times and Gazette.]

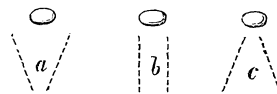

SIR,—The able paper in your Journal of the 10th of this month by Mr. Teale, of Leeds, on Stone in the Bladder, seems to have roused the Surgical Profession to consider the various modes of operating in such cases; and especially to bring under its observation the median method, in contrast with the lateral. From these observations of Mr. Teale and the letters from Mr. Bowman and Dr. Arnott in your last number, it is evident that the preference would be given to the median dilating method, if a proper instrument for this process could be constructed. In a letter which you did me the honour to publish in your Journal of November 19, 1859, I promised to offer to the Profession a dilator for this operation as soon as the woodcut could be made. I should have done so before this, but the instrument was to have been used in a case, the operation upon which has been unavoidably delayed, and I was anxious to report upon its practical use; however, as the subject is now under Professional consideration, I think I may follow in the steps of Mr. Bowman, and offer for that consideration an untried instrument; at the same time I believe, that when tried it will be found useful. I subjoin a woodcut of this dilator, it is made on the same principle as that published in your Journal for August 6, 1859, for dilating strictures of the rectum. The blades, of course, are small and turned up at the extremity in the form of a beak so as to run in the groove of the staff. Mr. Ferguson, of Giltspur-street, has made them of various sizes so as to suit the child or adult. For the mechanical description I must refer your readers to the number of your Journal above mentioned; the only difference which exists between the two instruments is the shape and size of the blades,—in fact its adaptation to the urethra, instead of the rectum, being made suitable for introduction through an artificial opening of small dimensions guided by a grooved staff. The principal benefit which I anticipate will be found from the use of this instrument is that the neck of the bladder and prostatic portion of the urethra are permanently kept dilated during the operation, permitting the introduction of the forceps and their free movement in the bladder, enabling the Surgeon to search for and grasp the stone. The parallel dilatation, also afforded by this instrument, I think, will be considered of great advantage.

In cases where the stone is so soft as to crumble under the forceps, it becomes a difficult matter in median lithotomy

to wash out the bladder, owing to the power of recontraction possessed by the neck of the bladder and prostatic urethra. It is, therefore, here very necessary to have an instrument which, while it keeps the parts dilated, permits of the introduction of the syringe, and allows of free exit to the washed-out particles of stone. A case of this kind occurred to my friend Mr. Lloyd, not long ago, at St. Bartholomew's Hospital; and he found it was impossible to wash out the bladder owing to the cause above stated. The stone was so soft that but small portions could be removed at a time, appearing like mortar upon the blades of the forceps.

Mr. Bowman's instrument, which appeared in your last number, can hardly be called a dilator; it is evidently but a guide for the finger, which is in reality the dilator. Its great use, and perhaps its only use, is to obviate the danger of displacing the parts, and to prevent the production of intussusception of the neck of the bladder, which might occur by using the naked finger. This form of instrument appears to me to have one great disadvantage—which is, that it dilates the superficial parts more than the neck of the bladder; in fact, the dilatation is of a conical form,—the base externally, and the apex internally, at the neck of the bladder, which obviously is the most dilatable portion of the canal through which we have to pass. Now, it is evident that it is more difficult to draw a body such as a stone through a flexible conical canal, from apex towards the base, than from base towards the apex, as may be seen by the adjoining woodcut. Nay, more, the traction from apex to base in this case is likely to produce displacement and intussusception, quite as dangerous as, although in the opposite direction to, that feared from the introduction of the finger without a guide. With the dilator which I propose, the movement is parallel, as I said before, but it could easily be

made to dilate the neck of the bladder more than the superficial parts, so as to make the base of the cone internal, and the apex external, if such should be deemed necessary.

The mode of using this instrument appears to me to be simple:—When the urethra is opened upon the staff, the dilator is passed along the groove, and the staff being withdrawn, it is properly adjusted, and the blades made to separate by means of the thumbscrew. When sufficient dilatation is obtained, the forceps are passed along between the blades, and dipped down in front of the crossbars into the bladder, moved about until the stone is felt and firmly grasped; the thumbscrew of the dilator should be then turned, so as to approximate the blades a little, and the instrument withdrawn, leaving the forceps and stone to follow in its track.

TRACHEOTOMY IN CROUP.

LETTER FROM MR. PRICE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Your impression of last week contains an interesting communication from Mr. Henry Smith, commenting on Dr. Richardson's theory regarding the formation of fibrous clots in the right side of the heart as the frequent cause of the fatal issue of croup, even after the performance of tracheotomy. As Mr. Smith's letter is mainly based on a short discussion which took place at the Medical Society of London, on the occasion of my alluding to a case of croup for the relief of which I opened the windpipe, I trust the particulars I then stated will not be uninteresting to your numerous readers.

On the afternoon of November 21st, I was requested by my friend, Dr. Maurice Davis, of Brunswick-square, to see an infant about twenty months old, who had been attacked with croup two days previously. All the symptoms of tracheitis were well marked. The difficulty of breathing was great, the pulse hurried and jerking, the accompanying fever high, the veins about the neck and face dilated, the eyelids wide open, and the eyes fixed and staring, while the anxiety of countenance plainly indicated the very great distress which the child suffered.

Dr. Davis had treated the case by blisters to the side of the neck, the warm bath, and small, but frequent doses of antimony. Finding, however, on the third day, that the disease was progressing, he sought my opinion regarding the propriety of making an artificial opening into the windpipe. The case appeared, in many respects, one in which the proceeding would be of value, as the disease did not seem to have made much advance down the tracheal tube, and the child was not so exhausted as to preclude the hope of immediate benefit resulting. The base of the right lung appeared slightly congested. Having resolved on performing an operation, I suggested that the infant should be placed under my care in the Great Northern Hospital, which was close at hand, so that the after treatment might be well attended to. To this, however, the mother objected, and about an hour after first seeing the little patient I divided three or four rings of the trachea, and inserted a silver tube. There was little or no bleeding, and the operation was easily performed. Before inserting the tube, I cut from either side of the windpipe a small elliptical portion, so that, should the canula become disengaged, the patency of the opening might be preserved. I know an instance in which such a proceeding saved the life of an infant, for during the first night after the operation the tube was ejected while the attendant was asleep, but respiration was unobstructedly continued through the enlarged opening that had been judiciously made.

The operation was attended with immediate relief to the breathing. Dr. Gibb, who was present, suggested that repeated doses of the decoction of senega, containing a small quantity of sesquicarbonate of ammonia, should be administered, in addition to beef-tea and brandy. In this plan, both Dr. Davis and myself acquiesced. After five or six doses of senega had been given vomiting occurred, so that it became advisable to give it by the lower bowel. The senega was administered with the view to its acting as an expectorant and stimulant, and to prevent the further formation of false

membrane, although when pushed it exerted its emetic and purgative properties.

The child passed the first night in comparative ease, and slept slightly; indeed, the improvement had been most marked. The pulse had fallen, and possessed greater vitality. The anxious expression had also fled, and, in all respects, the disease appeared to be abating. During the next day and night extra strength seemed to have been acquired; the breathing through the tube was quiet and regular; the pulse 98, and the respiration varied from 24 to 28. On the afternoon of the 23rd, forty-six hours after the operation, the child suddenly expired, without any apparent cause. The tube remained to the last pervious to air, so that no neglect on the part of the mother—the ever-anxious watcher on this occasion—had tended towards the unfortunate result. Previous to death, the little patient had exhibited great vivacity, and had actually stood up on the couch on which he had been lying, amusing himself with his playthings. The sudden termination to life in an infant which, at the time of my last visit, some few hours before, appeared certainly in no very critical position, caused me considerable doubting as to the cause of death. I saw the body about ten minutes after death; the lips were nearly of their natural colour; the countenance was not anxious, nor did the child seem to have suffered from any increased difficulty of breathing prior to dissolution.

Feeling at a loss how to account for the unfortunate result Dr. Davis kindly offered to make an examination of the parts concerned in the disease. He found the bases of both lungs congested, and the specific inflammation of the larynx extended down the trachea below the opening that had been made, but there was no appearance of false membrane. Scattered through the lungs were a few miliary tubercles. Unfortunately, the heart was not examined, so that I cannot be positive as to the existence of a clot in the right side of that organ. From my own suspicions, however, and the absence of any considerable lesion about the lungs and trachea, I am induced to accept the explanation offered by Dr. Richardson, that the formation of an *ante-mortem* clot was probably the cause of death.

The administration of senega and ammonia, I am sure, was of great advantage. Dr. Gibb informs me that he has often administered the former of these medicines with the best results in cases of croup; and from what I know myself of the action of senega on the bronchial and tracheal lining in checking inflammatory exudation, I shall for the future feel bound to give it a fair and extended trial.

I am, &c.

P. C. PRICE.

7, Green-street, Grosvenor-square,

RUPTURE OF CHORDÆ TENDINÆ OF MITRAL VALVE.—

“A prostitute, twenty-five years old, of plethoric constitution, while in the exercise of her profession, suddenly lost her senses, her breathing became embarrassed, and the skin of the face blue, and she was convulsed. She called out that she was being stifled; the pulse small and rapid; the heart's beats confused, tumultuous, and irregular; its sounds could not be distinguished; a distinct *frémissement* was felt over the præcordia. In a short time, cold sweats, complete loss of sensibility, and death from asphyxia. At the autopsy was found hypertrophy of left ventricle of heart; traces of chronic endocarditis; rupture of the tendinous chords which attach one papillary muscle to the anterior flap of the mitral valve.”

—*Journal de Méd. de Bruxelles.*

A HEAVY-WEIGHTED FAMILY.—The old gentleman is a native of Maryland, and in his seventieth year; was brought to the State of Kentucky when quite young, and has raised his family in the above county, consisting of six sons and three daughters. In the following table the height and entire weight of the family are given:—Father 6ft. 4in., 200lb.; mother, 6ft. 4in., 286lb.; Thomas, 6ft. 4in., 286lb.; James, 6ft. 6in., 215lb.; Sarah, 6ft. 6in., 165lb.; John, 6ft. 11in., 296lb.; Mary, 6ft. 2in., 150lb.; Elijah, 6ft. 2in., 210lb.; Matthew, 6ft. 2in., 220lb.; Eli, 6ft. 4in., 197lb.; daughter, 6ft. 3in., 160lb. Height, 70ft.; weight, 2329lb. The family are all living except the youngest daughter, are all wealthy, and of the first families of Kentucky. I might add, several grandchildren are over 6½ft., and are still growing.—*New York Tribune.*

REPORTS OF SOCIETIES.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

TUESDAY, DECEMBER 13, 1859.

F. C. SKEY, Esq., President, in the Chair.

A paper, by DR. HABERSHON, was read

ON THE ETIOLOGY AND TREATMENT OF PERITONITIS.

The author of the communication first alluded to the value of a knowledge of the causes of disease as a guide to right treatment, and to the importance of considering local disease as connected with a constitutional or general origin. In reference to peritonitis, he remarked that although written and spoken of as an idiopathic disease, we did not find any proof that the malady really existed in that character. An analysis of the records of 3752 inspections after death at Guy's Hospital, and extending over a period of 25 years, was brought forward as confirming this statement, and as an indication of the general plans of treatment. 501 were instances of peritonitis, and they were divided—First, into those in which the disease is set up by mischief extending to the peritoneum from without, as from adjoining viscera, injury, or perforation; secondly, those which might be called blood-diseases, connected with albuminuria, with pyæmia, or puerperal fever or erysipelas; and thirdly, those in which general nutritive change in the system is followed by acute or chronic peritonitis, as in struma or cancer, or after continued hyperæmia of the capillaries of the serous membrane, as in disease of the liver or heart, where very slight exciting cause suffices to produce acute mischief. Of the *first* division, there were 266 instances, and 102 of these arose from internal or external hernia, or mechanical obstructions, and in 19 of the internal kind. Reference was made to the mode in which the extreme tension of the intestine leads to intense congestion of the mucous membrane, diphtheritic inflammation, and ulceration in the direction of greatest tension, leading to perforation in many cases. Different modes of treatment that have been used were referred to, and the use of opium alone advocated; the addition of calomel, as tending to increase the changes of the mucous membrane just mentioned, without any corresponding benefit should preclude its use. 35 were injuries or operations directly affecting the serous membrane, and in 14 had followed tapping; many injuries of the abdominal viscera, proving fatal in a very short time; this number was lower than might be expected. The value of rest and of opium in all these cases as recommended by Dr. Stokes and Dr. Graves in the treatment of perforation, was dwelt upon, as well as the injury that would result from mercury in tending to prevent localisation of the mischief and increased depression. 56 were perforation of the intestine; 10 from hernia, 9 from the appendix cæci, 2 from the cæcum, 4 from cancerous disease of the colon, 9 from disease of the stomach, 15 from typhoid disease of the ileum, 4 from struma, 2 from ovarian adhesions, and 1 from cancerous disease of the vagina. In 5 other cases of fever, peritonitis had resulted, in two of which the perforation was not complete; 1 was of doubtful character, for the ulceration of the ileum was slight, and phthisis was also present. In 19 cases, fæcal abscess had taken place. In 42 cases the peritonitis was caused by extension of disease from the bladder, uterus, or pelvic viscera: thus, 10 from lithotomy, 6 from ovarian disease, and 14 from calculus in the bladder, cystitis, or stricture. In 11 cases, disease of the liver or gall-bladder had led to direct extension of disease to the serous membrane, and in 3 other cases it followed acute inflammatory disease of the colon, and from disease of the cæcum, not previously mentioned, in three instances. Thus 261 cases from the 501 were produced by disease not commencing in the serous membrane, but propagated to it from adjoining parts; and the author stated that in each of these instances, as far as medicinal treatment could be of service, he believed that the plan suggested by Drs. Stokes and Graves in instances of perforation of the stomach was of the greatest value, in promoting rest to the intestines, the local-

isation of the mischief, and the acceleration of reparative changes; in many instances that local depletion and the external application of anodyne remedies might be combined with advantage; but that mercury, in the form of grey powder or calomel with opium, was injurious rather than otherwise, as tending to prevent adhesions, exciting action from the bowels, or rendering their contents more fluid, and increasing the depressing effects of the disease on the nervous system. The *second* class of cases consisted of those in which peritonitis was set up by a changed condition of the blood, as in albuminuria, pyæmia, etc. Sixty-three instances were connected with Bright's disease, and in nearly all of an acute kind. It was stated that the peritoneum was rarely the only serous membrane affected. The treatment of the general disease was regarded as best calculated to remove the local affection, assisted sometimes by counter-irritants; but that the ready salivation produced by mercurials did not afford corresponding benefits. Ten were puerperal in their origin; in 13 pyæmia following operations, local suppuration; and 5 others were with erysipelas. Instances were alluded to in which serous membranes became simultaneously affected, perhaps pyæmic, or rheumatic, or from renal disease; and 3 of these were mentioned, one where peritonitis was connected with pericarditis and pleurisy, a second with pneumonia and dysentery, and a third with pericarditis, pleuro-pneumonia, and obscure renal mischief. As to the treatment of these cases, it was regarded that the local affection must be almost lost sight of in the general treatment, and that local depletion and mercurial preparations would not promote the cure in such instances. The *third* class of peritonitis were those connected with general nutritive changes, as cancer, struma, etc., or where, with continued hyperæmia of the peritoneal capillaries in cirrhosis, or heart disease, a very slight exciting cause suffices to produce acute disease. 70 cases rose with struma, 22 acute and 48 chronic and acute. The varieties of the strumous form of disease were mentioned, leading sometimes to serous effusions, to general adhesions, to perforation, or fæcal abscess. The ages were stated not to be limited to early life, many occurring between 30 and 40 years of age. It was urged that in all these cases the same general rules of treatment should be observed as in ordinary strumous disease, sometimes assisted by counter-irritants, very cautious local depletion, anodyne applications and opium; but the avoidance of purgatives and of mercurial preparations was recommended. 40 instances of peritonitis with cancer, besides those already mentioned, were next referred to, 9 in males, and 31 in females. In men, glandular organs were generally affected; and, in women, the ovaries or uterus; but, in 20 instances, the disease consisted of tubercles upon the peritoneum, generally with dropsical effusion: 19 of these were women, and 1 a man; the average age of the former 52, and evidently coming on after the cessation of ovarian functional activity. The inutility of diuretics, and the inadvisability of depressing measures, as mercurials, were spoken of; and it was stated, that paracentesis was often followed by increased effusion of lymph, and the best treatment consisted in sustaining the ebbing powers of life by every means in our power. The *last* cases were those of peritonitis associated with hepatic or heart disease. In 32 of this hepatic complication, 14 were chronic, 12 acute, and 6 acute and chronic. 5 had been previously referred to as rendered acute by tapping. In some instances pneumonia was present, and slight exposures to cold and wet evidently sufficed to induce acute changes. The degenerative arterial changes often found with cirrhosis were mentioned, and that this chronic state could be borne in mind in the treatment of the acute disease. It was stated that, in early cirrhosis, the usual treatment of peritonitis by calomel and opium was more serviceable than in any other form of peritoneal disease, on account of the stimulating effect of mercurials on the glandular organs of the abdomen; but that even here it was not necessary to produce salivation to ensure the beneficial effects. 9 cases were connected with heart disease. The general causes of peritonitis were:—

From hernia (19 being internal)	102
„ injuries; operations, as tapping, etc.	35
„ perforations of stomach, ileum, cæcum, appendix, colon, etc. (other 13 included under hernia, etc.)	43
And leading to fæcal abscess (2 otherwise mentioned)	17

From ulceration, with fever, without perforation ..	5
„ disease of the bladder or pelvic viscera; operations, as lithotomy, etc. ..	42
„ abscess of the liver, gall stone, etc. ..	11
„ acute disease of the colon ..	3
„ other disease of the cæcum ..	3
	261
From Bright's disease ..	63
„ pyæmia, puerperal fever, etc. ..	31
„ strumous disease ..	70
„ cancer (12 before mentioned) ..	40
„ hepatic disease (and 5 acute, from tapping) ..	27
„ heart disease ..	9
	240

The author concluded with the following propositions:—1st. That peritonitis is never idiopathic in its origin, and that we do not find any such instance as acute disease of the peritoneum coming on from mere exposure to cold; in such case, the cold tends to render acute an already existing morbid state. 2nd. That the consideration of the origin of the disease, either in a local or general source, is the best guide to treatment; whether—first, from extension of disease from adjoining viscera, as the ovaries, bladder, intestines, perforations, or injuries; secondly, from blood changes, as occur in albuminuria, pyæmia, or erysipelas; and thirdly, from almost imperceptible changes, or deficiencies, in general health, as in struma, or cancer, or climacteric changes, or as a consequence of the hyperæmia of cirrhosis, or heart disease. 3rd. That, in the first form, perfect rest, the avoidance of food as far as possible, and the mode of treatment recommended by Dr. Stokes, in producing rest to the intestinal canal and peristaltic action, and diminishing the collapse and prostration consequent on the disease—constitute the best mode of treatment; using, as far as need be, other means, as anodyne applications, local depletion; and, in many instances, also seeking to remove the exciting cause, as in cystic disease, etc. 4th. That where peritonitis is a symptom of blood change, as Bright's disease, pyæmia, etc., it may be best relieved by the treatment of the primary disease; but that here opium is sometimes of great value, and more effective without mercurial combination. 5th. That in the treatment of the third class, the consideration of the cause is also our best guide; that strumous and cancerous disease should be regarded in their general relations; and in those connected with hepatic disease, the remembrance of the condition prior to the supervention of the peritonitis should prevent us from using means calculated to increase the primary mischief; and that any benefit due to mercurial action may be attained without mercurial salivation. 6th. That, in general, the benefit ascribed to mercury in the treatment of peritonitis is not established, and may, perhaps, be correctly attributed to the opium with which it is combined.

Dr. COPLAND said that the statement of Dr. Habershon could not be disputed, that in ninety-nine cases out of a hundred peritonitis, whether acute or chronic, was a consecutive, and not an idiopathic disease. In many cases, however, met with in children, it was difficult to determine what was the more immediate disease. It often arose from disorder of the digestive mucous membrane, from consecutive disease of the glands, especially the lacteal glands. In many of these instances the peritonitis was coexistent with tubercular inflammation of other serous membranes, as of the brain and pleura. The author's treatment appeared to be correct as far as it went. In the majority of cases salivation should be avoided, but there were some cases in which it was required. The author had overlooked a variety of medicines which were useful in cases of peritonitis consequent upon blood-contamination, especially the external application of turpentine by stupes or embrocations, which might go hand-in-hand with the opium treatment. In puerperal diseases scarcely a case could be successfully treated without the use of opium and the external application of turpentine. The most valuable portion of the paper were the statistics; as to the causation of the disease there was nothing new developed; and in regard to treatment the paper was very deficient.

Mr. POLLOCK said that most Surgeons would agree with Dr. Habershon that, in cases of actual rupture of the intestine, mercury was worse than useless, and opium was the only treatment that could be adopted. In cases, however, where

slight bruises of the abdominal wall were followed by peritoneal inflammation, producing constipation, mercury, with the addition of local or general depletion, was often the Surgeon's sheet-anchor. He remembered the case of an old gentleman who was accidentally bruised in the abdomen while in bed, and who found his bowels in a state of discomfort for a few days. About a fortnight after constipation had set in he (Mr. Pollock) saw the patient. There was distinct tenderness, and a solid mass on one side of the umbilicus extending towards the pelvis, and it was concluded that there was a portion of intestine fastened together by the effects of inflammation, and not from any rupture. On the twenty-eighth day the symptoms had very much subsided, and the pain in the abdomen had almost entirely disappeared. During the whole period he had been taking mercury to a small extent, and on the twenty-ninth day the bowels acted for the first time. That, he thought, was a well-marked instance of success resulting from mercurial treatment with very little opium. In another case, occurring in a boy who was kicked by a companion, the mercury did not produce any marked effect till the boy was fully under its influence. He thought the author had not sufficiently distinguished the cases where mercury was injurious and where it was beneficial. He would ask whether Dr. Habershon, in cases of obstruction of the bowel, particularly the large intestine, had found the peritoneal coat of the intestines give way before the mucous coat? It was, he thought, of importance not to delay too long the opening of the large bowel when constipation had taken place from any cause situated in the ascending or descending colon. He had sometimes seen rupture of the peritoneum before the mucous membrane had given way.

Dr. HABERSHON said it was not his object to establish any new fact, so much as to draw the attention of the Society to peritonitis in its general aspect, rather than as a local and idiopathic disease. He had not referred to the remedy mentioned by Dr. Copland, nor to many others which might doubtless be beneficial. He had not had much experience in the use of turpentine; it sometimes produced intense pain when applied externally, and perhaps equal benefit might be obtained from other means of counter-irritation. He should be glad to know whether, in an undoubted, well-marked case of peritonitis, Dr. Copland would administer turpentine and castor-oil. In the case mentioned by Mr. Pollock, he was disposed to think the bowels would have acted as well without the mercury as with it. In many cases of obstruction, the opium, instead of confining the bowels, might really be regarded as a purgative.

Dr. COPLAND said he had employed turpentine externally and internally in inflammatory peritonitis, and in peritonitis consequent upon blood-contamination; and he knew of no medicine which, aided by other judicious means, proved more successful. In many cases, the doses of opium should be very large, given frequently, and combined with calomel and camphor. Camphor was especially beneficial where there was much blood-contamination. In cases of peritonitis arising from the impaction of calculi in the ducts, the employment of calomel with opium in large doses was often beneficial. He had lately been called to two such cases, arising from gall-stones in the gall-ducts, which were treated in that manner. One had recovered, and the other was proceeding satisfactorily.

Dr. BALLARD asked whether there were any precise data as to the relative cure of peritonitis with and without mercurial treatment. He was disposed to agree with the author as to the extreme value of the sole opium treatment, and should be content to trust to that treatment in almost any cases of acute peritonitis that presented itself. He had occasionally employed mercury externally. The general opinion of the Profession was in favour of a combination of calomel and opium, and the opinion was entitled to respect, and should lead them to retain the use of mercury, if not internally, in some other form.

Dr. HARE said, the treatment of peritonitis by opium or calomel, or by a combination of both, would depend very much upon the view taken of the cause of the disease. In cases of blood-disease, albuminuria, etc., opium would be given to cure the primary disease, and allay the pain; but where the inflammatory action was of a much more acute character, mercury, combined with opium would be found useful, together with local or general depletion. He had seen a case of very acute peritonitis coincident with pneumonia,—

a case as nearly idiopathic as any that could be conceived—in which mercury and opium, with local and general depletion, brought about a complete recovery.

Dr. SCHULOFF never used mercury in peritonitis. He had been lately called to a case of traumatic peritonitis, which was treated in the usual way without much benefit. He withdrew the mercury, and the effect was most marked. In such cases constipation appeared to him the result of Nature's own effort, which ought not to be counteracted.

Dr. HABERSHON said the records were taken from Guy's Hospital, and in nearly every case more or less calomel had been used. He had no doubt that in many cases depletion was of great value; but in such a case as that mentioned by Dr. Hare, which probably arose from struma, the administration of calomel to produce salivation, would, he thought, be detrimental, even though applied only externally. In the last class of cases which he had mentioned, the use of mercury tended very much to relieve that engorged state of the portal system which perpetuated the congested state of the peritoneum; but the beneficial results of mercury might be obtained without continuing it so as to produce salivation. In many of the best text-books, peritonitis was regarded as idiopathic in its origin, but he had failed to discover a single case of that character.

Dr. COPLAND thought that Dr. Habershon had confounded the use of mercury with salivation, which were two distinct things. The preparations of mercury acted most beneficially when no salivation was produced.

Dr. HABERSHON said he should be sorry to confound the two things; but in the best text-books mercurial salivation was spoken of as the best treatment for peritonitis.

The Society then adjourned.

THE EPIDEMIOLOGICAL SOCIETY.

MONDAY, DECEMBER 5.

DR. BABINGTON, President, in the Chair.

THE Report of the Diphtheria Sub-committee of this Society was read by Mr. J. N. RADCLIFFE.

The report stated that although in February last upwards of 200 circulars, asking for information and containing suggestions for observation, had been distributed among the members of the Society and others in various parts of the Kingdom; and, notwithstanding that the aid of the Profession generally in the inquiry had been sought, through the Medical Journals, the Committee had received, during a period of ten months, only thirteen specific reports and twenty-three general replies. Hence the results of the inquiry were entirely insufficient to form a basis for a general history of the rise and progress of diphtheria in the Kingdom. Nevertheless, the information which has been received respecting the disease was not without value,—1. From the additional light which is thrown, in several respects, upon the development of the epidemic; and, 2. as showing the highly important knowledge which might be obtained respecting epidemic diseases from an inquiry such as that conducted by the committee, if it were generally supported by the members (particularly the non-resident members) of the Society. The facts of chief importance which have been ascertained by this inquiry, may be summed up thus:—1. The positive occurrence of sporadic diphtheria in the counties of Kent and Essex in the years 1853 and 1854; also in different parts of the kingdom, at intervals within the last twenty years. 2. The unusual prevalence of throat affections of all kinds, and not unfrequently of a peculiar kind which might be described as of a quasi diphtheric character, prior to, or contemporaneously with the present epidemic of diphtheria. 3. The concurrent or intercurrent prevalence in the same locality, of epidemic diphtheria with epidemic scarlet fever, and the occasional occurrence of a diphtheric affection of the fauces in scarlet fever. The whole of these facts have an important bearing upon the history of the development of the present epidemic of diphtheria.—1. In reference to the introduction of the disease into the Kingdom from without. 2. In reference to the causes which have led to the development of the epidemic. 3. In reference to the relations of the

disease to cognate affections, and to scarlet fever. Upon all these points the foregoing facts are valuable, as suggestive of further inquiry, and as indicating the direction in which that inquiry should tend, as well in those districts in which the epidemic has prevailed as in those in which it now prevails. 4. The doubtful contagiousness of the disease, in some districts; its undoubted contagiousness, in others. 5. The insalutary state of the majority of the localities in which the disease occurred. 6. The greater liability to the disease being in the first decennium, or, to narrow the question, the second quinquennium of life. 7. The proportion of males in 100 cases being 42·3; of females, 58·2. 8. The nature of the treatment indicated.—1. The application of more or less stimulating or caustic applications to the diseased parts. 2. The regulation of the excretions. 3. The sustentation of the powers of the system. In concluding their report, the Committee remarked that although the information obtained by them in the present inquiry was exceedingly imperfect, yet it was sufficient to show that if the inquiry had been supported by the members of the Society to the extent that the Committee had hoped it would have been, a large amount of most valuable information respecting diphtheria would have been obtained; information of a character that could be obtained in no other manner than by the systematic co-operation of many and widely separated observers to one and the same end. The Committee suggested that the Society should take into consideration the propriety of adopting other and additional means, if such could be devised, for promoting or ensuring the more satisfactory co-operation of its members in such inquiries as the Society may set on foot; for the Committee felt assured that the present inquiry had proved in a great measure abortive, not so much from indisposition of the members to aid, as from an erroneous estimate of the value of the information which they possessed relative to the subject of inquiry. Thus, it was stated that, in the majority of letters with which the Committee had been favoured in answer to their circular, the writers had contented themselves simply with stating that diphtheria had not appeared in their neighbourhood, or that they had seen but one or two cases of the disease, and consequently their experience would be of no value to the Committee; yet the Committee had specifically asked for particular information respecting the prevailing character of throat-affections where the disease had not manifested itself, and for many items of information where it had, even if it were but in a solitary instance. The Committee further suggested, in respect to the present inquiry, that additional information should be specially sought concerning, 1. The date of the first case or cases of diphtheria which occurred in any district. 2. The occurrence of diphtheria in a sporadic or epidemic form prior to the present outbreak. 3. The character of the throat-affection which occurred contemporaneously with diphtheria; or that disease being absent, the character of the throat affections which had been observed immediately prior to its appearance in 1857, and subsequently. 4. The relationship existing between diphtheria and scarlet fever. If the suggestions of the Committee respecting further inquiry were adopted by them, the Committee expressed a willingness to continue their duties some time longer, notwithstanding the disheartening result which had attended them hitherto.

A discussion followed, in which Drs. Milroy, Camps, Babington, Sanderson, Greenhow, and Dr. McWilliam took part.

Mr. RADCLIFFE having replied, the meeting adjourned at ten o'clock.

"I once," writes Montaigne, "asked a very old man at Lucca, if he ever took the baths. He answered, that it was with him as it was with those who lived near Notre Dame de Loretto, and never made a pilgrimage to it; and that he never knew the baths of any use except to strangers and those who came from a distance. He added, that he noticed with much sorrow that for some years these baths were more hurtful than useful to those who took them; and that this arose from the circumstance, that in former days there was not a single apothecary in the country, and that Physicians were rarely met with; whilst at present the very contrary was the case. The manifest effect followed—that at these baths more persons died than were cured; and the end will be that they will fall altogether into discredit."—*Montaigne's Journal*.

OBITUARY.

MR. RICHARD SANDFORD, OF WOLVERHAMPTON.

THE remains of this respected gentleman were consigned to their final resting-place on the 8th inst. The principal Medical Practitioners of the town, and a number of the deceased's friends, anxious to pay a last tribute of respect to the deceased, followed his remains to the grave. At the cemetery the Rev. W. Dalton, B.D., vicar of St. Paul's, Wolverhampton, officiated, and after reading a portion of the funeral service, and before proceeding to the grave, he made a few appropriate remarks on Mr. Sandford's character as a Medical Practitioner and a Christian man. Mr. Dalton observed that he had known Mr. Sandford for a long time, as he had served his apprenticeship to the Surgical Profession in Wolverhampton. Mr. Sandford went out to Jerusalem to help in the mission there established, and had acted as Surgeon to the excellent Hospital opened there for the benefit of the Jews. On returning to this country, such was the estimation in which he was held, that he not only received many presents from the members of the mission; but the Jews, who had experienced his skill and sympathy, presented him with a silver inkstand, a suitable inscription in Hebrew having been engraved upon it. Mr. Sandford commenced practice in Wolverhampton on his return from Palestine, and was appointed Surgeon to St. Paul's Provident Society at an early period of his residence. In this Institution he took a lively interest, and ministered to the sick members with great care and skill. For some years Mr. Sandford acted as one of the Surgeons at the South Staffordshire Hospital, and took a more than ordinary interest in the cases. He was so earnest in following out cases committed to his care, that even his private practice seemed to be secondary in his eyes.—The above is an extract from an address that was listened to with the most solemn attention, and which, a local paper says, "impressed all that this town had lost a most skilful Surgeon and a most useful member of society."

MR. THOMAS ELLIOT, OF CARLISLE.

We gave a short notice of the death of this esteemed Surgeon soon after the event, which took place at Leeds, on the 18th of October last, the deceased gentleman being then 42 years of age. We now append the following particulars from the *Carlisle Journal* :—

"Having completed his studies in Edinburgh, Mr. Elliot repaired to Paris, where, for two sessions, he diligently availed himself of every opportunity of perfecting his Professional knowledge. He devoted himself in particular to anatomical pursuits, and to the acquirement of a thorough knowledge of operative surgery, availing himself assiduously of the unrivalled advantages which the French capital affords. In 1839, Mr. Elliot obtained the diploma of the College of Surgeons of England, and at once settled down in practice in Carlisle, with his brother, the late Dr. William Elliot. Mr. Elliot from the first devoted himself especially to the practice of surgery; and having directed especial attention to the subject of squinting, his published observations upon that subject excited much attention, and attracted to him many persons labouring under that deformity. From that time Mr. Elliot took the place which he maintained till his death, of the leading surgeon of the county. Nor was his reputation confined to Cumberland; Mr. Elliot was highly esteemed and frequently consulted by Practitioners in the adjoining counties of Northumberland and Westmoreland, and in the south of Scotland. Some years ago Mr. Elliot while excising the elbow-joint of a man of a very depraved constitution, received an injury by the results of which his health for a long time was seriously impaired. He was compelled to retire from practice for many months, and at this period visited Egypt and the East. On his return his health appeared to be re-established, but he was never so strong as previously; yet he laboured most assiduously, and we believe went through an amount of bodily and mental exertion which few could have maintained. Mr. Elliot has left behind him a name, which will be long remembered in the North of England as a distinguished surgeon, and an amiable and philanthropic citizen."

MEDICAL NEWS.

ROYAL COLLEGE OF SURGEONS.—The following gentlemen were admitted Members at a meeting of the Court of Examiners on Friday, the 9th of December :—

Barnes, Thomas B., Thaxted
Batty, Richard F., Pimlico
Buller, W. B., Sutton, Ely
Bunch, J. J., Wolverhampton
Cocker, J., Blackpool, Preston
Cooper, Thomas R., Oldbury, Birmingham
Culham, James, Drummond-street, Euston-square
Hampton, Edward, Southwark
Johnson, Walter, Colechester
Jones, John, Ilfracombe
Large, Joseph, Oswestry
Ling, J. M., Saxmundham
Parsons, Charles H., Shelton, Coventry
Phillips, E. B., Hales Owen
Sadler, P. L., Warrington
Sedgwick, C., Hollingbourne
Storow, John, Newbottle, Durham
Winterbotham, J., Castleton

[The preceding gentlemen had previously been in practice as Licentiates of the Society of Apothecaries.]

Hicks, Charles, Smethwick, Birmingham
Meredith, R., Netherton
Sanders, Thomas, Cheshunt

ERRATUM.—In the List of Members of the College admitted to the Fellowship by election, the following were omitted :—

Cowen, Henry Lionel, Ceylon Rifles
Nugent, Richard, Wolverhampton

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 15th of December :—

Andrew, Augustus Littlewood, Manchester
Bate, Henry Francis, Somersetshire
Dunn, Frederick, Wolverhampton
Hawkins, Thomas Henry, Reading
Hodgson, Henry Frederick (as an Assistant), Cradley-heath, Stafford
Hughes, Robert, Trefriw, North Wales
Michell, Thomas, Redruth, Cornwall
Murray, William, Chele-le-street, Durham
Tacey, William Green, Louth, Lincolnshire
Thompson, John, Snaith

The following gentlemen also on the same day passed their First Examination :—

Griffith, Alfred L., Old Kent-road.
Macnamara, James, Great Ealing, Middlesex
Tofto, Henry, Cambridge

APPOINTMENTS.

NAYLER.—Assistant-Surgeon G. Nayler, Bombay Army, has been appointed by Sir C. Wood, to the Warley Dépôt, *vice* Assistant-Surgeon Williams, resigned.

SANDERSON.—Dr. Sanderson, of Gloucester-place, Hyde-park, was elected last week Assistant-Physician to the Hospital for Consumption, Brompton.
SMITH.—At a General Meeting of the Governors of the City Dispensary, held on Monday, December 19, Dr. William Abbotts Smith was elected to fill the office of Physician to that Institution, rendered vacant by the resignation of Dr. T. W. Jones.

DEATHS.

COAR.—December 12, at Oxford, Thomas Tennant Coar, Surgeon.

CROKER.—December 16, at Cross Cottage, Bovey Tracey, John Gifford Croker, M.D. aged 71.

DAVIDSON.—December 19, at Dhufield, Gourrock, N.B., William Davidson, M.D.

DUNLOP.—December 14, at Whitmuir Hall, near Selkirk, Dr. Walter Dunlop, late of Rochdale.

ELLIOT.—December 9, at Haltwhistle, Robert Elliot, M.R.C.S. Eng., aged forty-one.

FULFORD.—December 18, at Brighton, William Fulford, Resident Medical Officer for thirteen years of the Public Dispensary, Carey-street, Lincoln's-inn, aged 43.

FULTON.—December 12, at his residence, Clonmore, Stillorgan, Henry Fulton, M.D., aged sixty-one.

GRAHAM.—December 12, at his residence, Eden Brow, Carlisle, Robert Hay Graham, M.D., aged sixty-nine.

HEGEMAN.—Recently, at Manningsville, United States, Adrian Hegeman, M.D., formerly of New York, aged 40.

SPRY.—December 5, Joseph Hume Spry, M.D., of Bath, aged eighty-four.

WILSON.—December 2, at No. 56, King-street, Stirling, North Britain, John Wilson, M.D., Surgeon R.N.

A BARCELONA GENTLEMAN advises incorrigible smokers to use potatc-leaves instead of tobacco; they will then get a solanaceous plant not virulently poisonous.

DR. BURDEL, of Vierzon, informs the Academy of Medicine, through the mouth of M. Bernard, that intermittent fevers are always accompanied with glucosuria. This is an assertion whose truth may be readily ascertained at all events.

EXPENSES OF A FEW ROYAL COMMISSIONS.—Lunacy Commission (Scotland), 1741*l.*; Dublin Hospital Commission, 824*l.*; Irish Lunatic Asylums Commission, 3100*l.*; Army Sanitary Commission, 1756*l.*

MEDICAL STUDENTS in Lisbon have of late years diminished in numbers. In the Medical year 1838-39, 271 *inscriptions* were noted; but in 1848-49, 62; and, in 1858-59, only 30. In 1844-45, 54 theses were defended; and in 1858-59, only 8.

FOREIGN MEDICAL STUDENTS IN PARIS.—Besides the 988 *inscriptions* of the Paris Medical Students for 1859-60, there are 48 of Foreign Medical Students entered in a special register under the title *Elèves bénévoles*. The number last year was 34.

M. COURTY, of Montpellier, has, he says, cured a lady of an attack of asthma, on whom for four years all the usual remedies had been tried in vain. His remedial agent was injecting six drops of solution of sulphate of atropine under the skin, as near as possible to the pneumo-gastric nerve. The lady has been well for two months.

SUDDEN DEATHS IN RUSSIA DURING 1857.—These are returned as amounting to 14,755. Among the proximate causes poisoning is returned in 168, crushing (running-over?) in 948, asphyxia in 1089, wounds in 201, freezing in 48, excessive intoxication in 1793, various forms of injury in 3223, and different diseases in 6177.

MORGAGNI so firmly believed in the contagion of phthisis, that he admits, in his letters, to have scarcely ever made an autopsy of a tuberculous person. "When I was young," he says, "this was for my own preservation; and now I am old, it is for the sake of the youthful students who surround me."

LAENNEC inoculated himself with tuberculous matter and Alibert and Bielt inoculated themselves with cancerous matter; and all the three concluded, from the absence of any local results, that these morbid products were not inoculable. It is a curious fact, nevertheless, that Laennec should have died phthisical; and Alibert and Bielt of carcinomatous affections.

LA SOCIÉTÉ D'ACCLIMATION proposes to offer a prize of a thousand francs to any one who will invent a means of destroying an animal, inhabitant of Martinique, called *Bothrops Lanceolé*, or in vulgar tongue *fer de lance*. A great many persons are mutilated by the bite of the animal; and about fifty persons per annum, out of a population of 125,000, fall victims to it. M. Cloquet recommends the introduction of the African stork as a way of destroying it.

LORD BACON'S SKULL.—Quaint Thomas Fuller, in his "Worthies," article "Westminster," after relating the burial of Sir Francis Bacon by his express desire in St. Michael's church, St. Albans, adds:—"Since I have read that his grave being occasionally opened, his skull (the relique of civil veneration) was by one King, a Doctor of Physic, made the object of scorn and contempt; but he who then derided the dead has since become the laughing-stock of the living."

"So self-sustaining is the configuration of the limbs that an elephant shot in the brain by Major Rogers in 1836 was killed so instantaneously that it died literally on its knees, and remained resting on them. About the year 1826 Captain Dawson, the engineer of the great road to Kandy, over the Kadaganava-pass, shot an elephant at Hangwelle, on the banks of the Kalawy Ganga; it remained on its feet, but so motionless, that after discharging a few more balls, he was induced to go close to it, and found it dead."—*Sir E. Tennent's "Ceylon,"* Vol. ii. p. 298.

THE Russians, not to be outdone in the present extensive mineral-water movement, which is now going on in France, Germany, and England, have, through the mouth of M. Grabowsky, called attention to the lake of Golaià Pristane, whose muddy waters possess, *on dit*, remarkable curative properties. This village of Golaià is situated on the Dnieper. A Kherson Doctor has analysed the mud, and has found in it iodine and bromine. It appears that this salt lake yielded salt up to 1845, but that since that year of inundation the manufacture has been stopped.—*L'Union Méd.*

A WORK OF CHARITY.—The wife and nine children of a Medical man, formerly in practice in Middlesex, sailed on the 30th November to join him in New Zealand. They had been supported for four years by subscriptions obtained from the Profession. The passage-money amounted to £126, which was also paid, with the exception of £35. Efforts to pay the balance are now being made, as also to send a few pounds to the family in New Zealand. Donations are received by Messrs. Coutts in favour of "*The Doctor's Family*." The name is not given from motives which are easily understood.

WHAT a seaman can do in the way of travelling, and carrying, and dragging, was ascertained during the Arctic voyages in search of Sir J. Franklin. The maximum weight proper per man was ascertained to be 220 lbs.; and of that weight, 3 lbs. per diem was consumed by each man for food and fuel—viz., 1 lb. of bread and 1 lb. of meat, while the other pound comprised his spirits, tea, cocoa, sugar, tobacco, and fuel for cooking. Upon this estimate it was found that, for a hundred days' journey, they could march ten miles per diem, and endure a temperature with impunity of 50 or 60 degrees below the freezing point.—*Once a Week*.

SWALLOWS' nests have long been objects of commerce amongst the people of Eastern countries, who consider them as nutritive and aphrodisiac. The weight of these nests annually exported from the great Indian Archipelago is reckoned at about 242,000 lbs.—the value being about 150 francs per lb. for the first quality, 100 francs for the second quality, and 70 francs for the third. These nests are also sold in Paris in small quantities at about 6½ francs per nest weighing 8 grammes (two drachms). The researches of M. Payen show that a glutinous and alimentary substance forms generally the greatest part of these nests, and is a peculiar secretion nitrogenous and analogous to animal mucus, admitting sulphur into its composition, without any organisation, swelling under the action of cold and especially of hot water, which dissolves the greater part, and is incapable of producing a coagulable solution when cold. M. Payen proposes to call this matter "cubilose" (cubile).

REMARKABLE LONGEVITY.—A correspondent, Mr. Arthur Bowes, of Upper Clapton, informs us that the following remarkable instances of longevity occurred in the obituary of the *Times* of the 8th inst.—viz., nine deaths at the respective ages of 94, 79, 81, 96, 77, 84, 87, 91, and 76, making a grand total of 765, or an average of 85 years each. Similar instances of longevity may frequently be noticed by studious examiners of the column in which we record the mortality of the day. For example, in the list of deaths in the *Times* of December 19, we find that one-third of the number (eight) took place at the following advanced ages—viz., 78, 83, 80, 87, 70, 74, 85, and 68, giving the high average of 78½ years to each person. The *Times* of Wednesday recorded the deaths of eight elderly people, whose ages were respectively 80, 85, 84, 80, 75, 86, 83, and 76, giving the high average of 81½ years for each life. Six of the deceased were gentlemen, the two old ladies having attained the respective ages of 86 and 83. One of the octogenarians was a dignitary of the Church.

OPERATIONS UNDER HYPNOTISM IN PARIS.—M. Azam, a Physician of Bordeaux, has recently come to Paris full of a discovery of a new mode of performing surgical operations during insensibility. New it is not, for he was first led to its investigation by Mr. Braid's writings on "Hypnotism;" but he has performed various additional experiments respecting it. The subject sitting or lying down, the operator places a mirror a few inches from his eyes, and in such a manner, that the eyes are directed strongly upwards by the superior recti muscles kept at their extremest point of contraction. In this attitude convergent strabismus is produced, together with considerable fatigue of the eyes. After scarcely two or three minutes the pupils first contract and then dilate, the eyelids first rapidly oscillating and then closing—the patient soon, in act, being asleep. Now are observed two symptoms which are in a greater or less degree almost constantly present—viz., *catalepsy*—in all points resembling the affection so named—and *anesthesia*, which lasts from three to fifteen minutes, and which is followed by very marked hyperæsthesia. Any of these phenomena may be cut short during their manifestation by friction of the eyelids or by directing on them a current of very cold air. MM. Broca and Follin have repeated this

experiment with the same results; and in a case under their care a perineal abscess has been opened during hypnotism without any pain whatever.

DR. HAMMOND has undertaken experiments to test the theory of Frerichs concerning uræmia. Frerichs regards the symptoms of poisoning of the blood so often observed in Bright's disease, not as the direct effect of urea in the blood, but as the result of the conversion of the urea into carbonate of ammonia. He performs two series of experiments; one on healthy animals, and another on animals without kidneys. The substances injected were urea, urea and vesical mucus, carbonate of ammonia, nitrate of potass, and sulphate of soda. His experiments do not confirm Frerichs' theory. In no case in which urea was injected into the blood was ammonia discovered in the respired air, in the matters vomited, or contained in the stomach. It follows, in short, from his experiments, that urea alone, or combined with vesical mucus, or carbonate of ammonia, and sulphate of potass, injected into the blood of animals, will not cause death; that nitrate of potass, introduced in a similar manner, is rapidly fatal; that death follows the injection of each of these substances when the kidneys are removed. In no case is urea introduced directly into the circulation changed into carbonate of ammonia.—*Gaz. Méd.*

PRIZE QUESTIONS PROPOSED BY THE ACADEMIE DE MÉDECINE FOR 1860 AND 1861.—The Academy Prize of 1000 francs for 1860: "What means are there of preventing the accidents which the employment of ether or chloroform may give rise to; and what are the means of remedying them?" for 1861, "Disinfectants and their therapeutical applications." The Portal Prize of 700 francs for 1860: "The vascular obstructions of the circulatory system of the lungs, and the practical applications which may be thence deduced, *i.e.* examine by means of positive observations the various species of sanguineous concretions which may obstruct the vessels of the pulmonary circulation, appreciating the causes, the immediate effects, and the ulterior consequences; also seek for the mechanism of cure of these morbid conditions, determine the signs which permit their recognition, and lay down the treatment they demand." The Prize of 1000 francs for 1861: "Purulent inflammation of the lymphatic vessels, and its influence on the economy." Madame Bernard de Civrieux' Prize of 2000 francs for 1860: "Appreciate the influence of Chloro-anæmia on excessive excitement of the nervous system, both as relates to diagnosis and treatment. With respect to diagnosis, the cases must be especially dwelt upon in which the nervous excitement has been mistaken for acute or chronic affections of the part in which such excitement has been seated." The Prize for 1861: "Angina Pectoris." The Capuron Prizes for 1860, each of 1000 francs:—1st. "Puerperal paralysis;" 2nd. "Determine by medical observation the physiological and therapeutical action of natural sulphurous mineral waters; and specify the pathological conditions in which one spring should be preferred to another." The two Prizes for 1861: 1st. "The influence which the diseases of the mother during pregnancy may exert on the constitution and health of her offspring;" 2nd. "For the best work recently published on mineral waters." The Barbier Prizes for 1860 and 1861, the former of 2000, and the latter of 4000 francs, to be decreed to the person who shall have discovered a complete means of cure for diseases reputed incurable, as hydrophobia, cancer, epilepsy, scrofula, typhus, cholera, etc. The Amussat Prize of 1000 francs for 1861, to be decreed to the author of the work or researches, based both on anatomy and experience, which has realised or prepared the way for the most important improvement in surgical therapeutics. (This prize has been adjudged this year to M. Ollier, for his researches on transplantation of periosteum.) The Orfila Prize of 2000 francs for 1860, for "Researches on poisonous mushrooms, in their chemical, physiological, pathological, and especially their toxological relations." The Itard Prize of 3000 francs for 1861, to be adjudged to the author of the best book or memoir on practical medicine, as applied to therapeutics, such work having been published at least two years. The competing essays to be written in French or Latin, and delivered at the Académie by the 1st of March of the respective years.

ST. LUKE'S HOSPITAL, NEW YORK.—This Hospital, which has been recently added to the Medical institutions of New York, is a commanding edifice of brick, with brown stone

trimmings, built in the Norman style of architecture. In the centre is a handsome chapel; right and left of it a lofty square tower, from which on either side the Hospital wings extend, three stories in height. The entire frontage of the building is 280 feet. The wards are 100 feet in length by 30 in breadth, and along either side are ranged the white-curtained beds, each furnished with a table and small carpet. There are a few smaller wards for cases which require seclusion. The wards terminate in the central chapel, whose acoustic properties are such, as to render the services audible to the extremities of the building. The ventilation is most perfect; for there is but a single range of wards between the external walls, and these bounded again by broad and airy corridors; while, to avoid the possibility of contamination, a large revolving fan in an adjoining building, connected with a steam-engine, is able to drive a current of fresh air into the Hospital, and change the entire atmosphere of the house in a very few minutes. The Hospital is intended to accommodate 200 patients, and is under the charge of a staff of four consulting, and four attending Physicians, the same number of Surgeons, a Pathological Chemist, an Admitting Physician, and a Resident. Each ward is under the superintendence of a sister, who sees that each prescription is administered, and each order of the Medical attendants carried out; while the menial offices are performed by nurses, male or female, under her supervision. One main feature of the Hospital is, that it is not intended for the destitute only, but for the sick of all ranks, whose domestic arrangements do not enable them to be well nursed at home. A bed in one of the general wards may be had for a few dollars a-week by those who are able to pay, while those who cannot pay, are accommodated gratuitously. Moreover, there are comfortable private rooms, with baths and other conveniences, for the reception of strangers taken sick in the city, and others who wish to combine the precision of Hospital attendance with the luxuries of home. In fact, the leading feature of St. Luke's is, that it is a home for those who enter its walls; where no one is treated as a pauper, or tended by hirelings, but where all the arrangements are under the personal care of a sisterhood of Christian women, refined and educated ladies who have given their lives to the work. This Hospital was projected, and mainly carried out, by the Rev. Dr. Mechlenberg, Rector of the Church of the Holy Communion at New York, who visited England a few years ago, and inspected the leading Hospitals here, and on the Continent. It is supported by that vigorous offshoot of the English Established Church, which flourishes, although a non-established church, among our American kinsmen; yet it gives its benefits unsparingly to all alike, without distinction of creed. We can only express our fervent hope that St. Luke's may, by its ventilation, be exempted from those Hospital diseases, pyæmia and the like, which so often here render the highest exertions of Surgical skill useless.

VITAL STATISTICS OF LONDON.

Week ending Saturday, December 17, 1859.

BIRTHS.

Births of Boys, 952; Girls, 879; Total, 1831.

TO CORRESPONDENTS.

*In the First Volume of the***Medical Times and Gazette**

For 1860,

DR. SIMPSON'S

CLINICAL LECTURES ON THE DISEASES OF WOMEN

WILL BE CONTINUED, INCLUDING

OCCASIONAL CLINICAL LECTURES ON CASES IN OBSTETRIC SURGERY.

CRANIOCLASM—A NEW FORM OF CRANIOTOMY.

FIBROID TUMOURS AND POLYPI OF THE UTERUS.

INFLAMMATORY AFFECTIONS OF THE UTERUS AND VAGINA.

DISPLACEMENTS OF THE UTERUS.

DISEASES OF MENSTRUATION.

PHYSICAL DIAGNOSIS OF DISEASES OF THE UTERUS, OVARIES, ETC.

SURGICAL OPERATIONS ON THE VAGINA AND PERINEUM.

ALSO, A COURSE OF LECTURES

ON EXPERIMENTAL PATHOLOGY AND OPERATIVE PHYSIOLOGY,

DELIVERED DURING THE PRESENT WINTER SESSION,

(Specially reported for this Journal, and corrected by the Lecturer,)

BY PROFESSOR CLAUDE BERNARD,

Member of the Institute of France, Professor of General Physiology at the Faculty of Sciences.

AND OCCASIONAL LECTURES

BY

EMINENT LONDON TEACHERS.

In the same Volume,

A SERIES OF PAPERS WILL APPEAR

BY DR. CONOLLY,

ENTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE :

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,

SENILE INSANITY,

VARIETIES OF INSANITY WITH PARALYSIS,

UTERINE AND OVARIAN CASES.

*Mr. Leeming's case of Bronzed Skin shall appear in an early number.**Mr. Griffith's letter on Scarification of the Epiglottis shall appear next week.**Staff Surgeon Rennie's Case of Secondary Hæmorrhage shall appear in an early number.**Dr. H.—We do not think the publication of the letter on the Association of Foreign Graduates would assist the objects of the Association.**Mr. Charles.—We cannot publish the list of successful candidates for the East India appointments until Sir Charles Wood's approval has been made known.**A Subscriber in advance.—It is entirely a matter of local arrangement. In many districts the Union Medical Officer attends the master and mistress of the workhouse as a part of his contract. In others they are looked on as private patients.**Argentis.—The Act does not prevent Foreign Graduates from using their academical titles; but those graduates who are not registered cannot claim the privilege of registered persons laid down in Clauses 31, 32, 33, 34, and 35; and it is distinctly laid down in clauses 36 and 37, that unregistered persons cannot hold certain appointments, or sign valid certificates required by any Act of Parliament.**A Protesting Member.—Several protests will probably be sent in this week to the Council of the College. It is high time that the present "sale of indulgences" should be stopped. We are informed that, not satisfied with inflicting Messrs. Horton and Meredith upon the Dudley Practitioners, the Dispenser at the Dispensary is also to obtain the College diploma on equally easy terms. If this be true, it is quite clear that the Council are pursuing a course which will utterly destroy the College.*

ENGLISH AND FRENCH NAMES.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—The remarks made by some of your correspondents on the English spelling of French names and vice versa, bring to my recollection a curious mistake I observed some months ago in a paper in a French Journal. The writer of the article I allude to quoted a "M. Bart." On investigation I found that the author he referred to was Sir Henry Marsh, Bart. Disregarding the punctuation, the French writer had, after all perhaps not very unnaturally, mistaken what appeared to him to be the last word for the essential part of the name. I am, &c.

Dublin, December 16, 1859.

A CONSTANT READER.

ALCOHOL IN THE BLOOD.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

Sir,—I see a communication in your last number, in reference to the entrance of alcohol into the blood. There is nothing new in this fact. When I was at College in Dublin, in the winter of 1833, a drunken man had a scuffle with the watchman in one of the streets near the Mercer's Hospital. The man fell in the scuffle, and died during the night. Of course it was necessary to have a post-mortem examination to ascertain whether the man died from drunkenness, or from injury at the hands of the watchman. I was permitted to see the dissection of the brain, which was taken to the Anatomical Theatre of the Digges-street school. There was a small quantity of fluid in the ventricles. It smelled very strongly of whiskey, and when a lighted candle was applied to it it burned away with a blue flame. I am, &c.

Coleraine, Ireland, December 19, 1859.

JAMES C. L. CARSON, M.D.

COMMUNICATIONS have been received from—

Professor SIMPSON; Dr. CONOLLY; Mr. TEALE; Dr. M'CORMACK; Dr. RICHARDSON; Dr. BARCLAY; Dr. HALFORD; Dr. LEARED; Dr. PEACOCK; Mr. GRIFFIN; Mr. LEEMING; Dr. PHOEBUS, Giessen; Mr. GRIFFITH; Mr. PARKER; Dr. HITCHMAN; Mr. CUST; Dr. CREGEEN; Mr. CROOKES; Mr. PARROCK; Mr. BRIDGES; Mr. HUGHES; Mr. NAYLOR; Dr. SMITH; Mr. VINCENT; Dr. APPLETON; Dr. THORN; Mr. DUNSTAN; Dr. MACADAM; Mr. BOSISTO; Mr. DAVIDSON.

APPOINTMENTS FOR THE WEEK.*December 24. Saturday (this day).*

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

26. Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

27. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

28. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopedic Hospital, 2 p.m.; Middlesex, 1 p.m.

29. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

30. Friday.

Operations, Westminster Ophthalmic, 1½ p.m.

EXPECTED OPERATIONS.

King's College Hospital.—The following Operations will be performed this day (Saturday):—

By Mr. Fergusson—Removal of Tumour from Leg.

NEPENTHE, OR ANODYNE TINCTURE

(OBTAINED EXCLUSIVELY FROM OPIUM),

PREPARED AT THE LABORATORY OF FERRIS, TOWNSEND, LAMOTTE, & BOORNE,
MANUFACTURING CHEMISTS AND WHOLESALE DRUGGISTS, BRISTOL.

This preparation has now been for many years extensively used by a large number of eminent members of the Medical Profession with the greatest success. It does not produce headache, stupor, giddiness, prostration of strength, constipation, or the usual unpleasant symptoms attending the use of other preparations of opium.

Nepenthe has frequently been found of essential service in cases of Cancer, where every other opiate has failed.

The following Testimonials received from Medical gentlemen in extensive practice will be regarded as satisfactory proof of its efficacy :—

MEDICAL TESTIMONIALS.

"Having prescribed your 'Anodyne Tincture' in many cases, I would strongly recommend its more general adoption. It is especially useful in the wakefulness common after parturition, or other unusual exertion or excitement. It produces a refreshing sleep, and I do not remember any case in which it has caused the objectionable effects of the other opiate preparations."

"S. Wellington-street, London-bridge, August 14, 1856.

"SAM'L. GRIFFITH, M.D. London, M.R.C.P.

Consulting Physician-Accoucheur to the Farringdon Dispensary,
Physician-Accoucheur to St. Thomas's Hospital, &c."

"Ipswich, March, 1859.

"Gentlemen,—I have great satisfaction in bearing testimony to the value of your 'Nepenthe,' in relieving suffering from disease, and in procuring sleep where ordinary narcotics fail or disagree. For several months I have found it very effectual in relieving a great sufferer when all the ordinary anodynes had ceased to benefit, and although the dose has not been increased for months, the relief is as complete.

"'Nepenthe' is a very valuable addition to our means of relief, and the Profession and the public are greatly your debtors for it.

"I am, Gentlemen, yours obediently,

"EDWD. BECK, M.D. Cantab.

Physician to the East Suffolk and Ipswich Hospital."

"Portland-place, Reading, Nov. 21, 1856.

"To Messrs. Ferris & Co.

"Gentlemen,—'Nepenthe' has, for some time, been a favourite narcotic with me, and I infinitely prefer it to any preparation of opium now extant. It has proved a remedy of great value in all cases of Neuralgia, Chronic Rheumatism, Hypochondriacism, and indeed all affections where the use of a sedative is indicated; and in Delirium Tremens it is certainly invaluable, performing its operation upon the system, without leaving those distressing feelings consequent upon the use of opiates in general.

"I remain, Gentlemen, your obedient Servant,

"WILL WOOD BRADSHAW, M.D. M.R.C.P. & F.R.C.S. Lond. &c. &c. &c."

Extract of a Letter from the late G. W. CAINES, Esq. M.R.C.S.

"Uffculme (Devon), Feb. 16, 1854.

"Please to send me some 'Nepenthe,' as I have a patient with cancer in the breast, with whom no other preparation of opium agrees. I have tried them all."

NEPENTHE may be procured direct from Messrs. FERRIS and CO., 4 and 5, Union-street, Bristol; from respectable Dispensing Chemists throughout the Kingdom; and from the following Agents:—

LONDON:—Mr. Thos. Keating, 79, St. Paul's-churchyard; Messrs. Evans, Lescher, and Evans, 60, Bartholomew-close; Messrs. Savory and Moore, 143, New Bond-street; Messrs. J. Bell and Co., 338, Oxford-st.

MANCHESTER:—Mr. James Woolley.

LIVERPOOL:—Messrs. Clay and Abraham; Messrs. Evans, Son, and Co.; Messrs. Clay, Dod, and Case.

BIRMINGHAM:—Messrs. Southall Bros. and Co.

YORK:—Messrs. Butterfield, Clarke and Co.

NORWICH:—Messrs. Smith and Sons.

PLYMOUTH:—Messrs. Balkwill and Co.

EXETER:—Mr. Geo. Cooper; Messrs. A. Evans and Co.

EDINBURGH:—Messrs. Raimes and Co.

As many imitations of Nepenthe have been attempted, the signature of FERRIS and COMPANY is placed over the cork of every bottle of the true preparation; and none purchased without this protection can be depended upon.

DR. DE JONGH'S

(Knight of the Order of Leopold of Belgium)

LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,

Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. DE JONGH, of the Hague. I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. DE JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.

WALTERS' INDIA-RUBBER URINALS.

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. Mr. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.

16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.

To Students and others.—You will do
well to inspect the NEW STOCK of Messrs. MILLIKIN and LAWLEY, 161, Strand, adjoining King's College, where the best and most modern INSTRUMENTS may be had at very reasonable charges. Trusses, Crutches, Splints, Legs, and all kinds of Surgical Appliances, made to order with precision and despatch.

Those who cannot swallow Cod-Liver
OIL in its crude state should try NEWBERRY'S COD-LIVER OIL CAKES.—“The gingerbread is extremely light and pleasant, the flavour of the oil being completely covered.”—Medical Times, Feb. 12th, 1859. Packets, 1s. 9d. and 3s. F. NEWBERRY and SONS (Proprietors of the “PULVIS JACOBI VER. NEWBERRY'S”) 45, St. Paul's Churchyard, London. ESTABLISHED A. D. 1746.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, previous, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

Great Saving in the Purchase of New

MEDICAL GLASS BOTTLES and PHIALS at the NORTH LONDON GLASS BOTTLE WORKS, ISAACS and SON (Proprietors)—London Warehouses, 24 and 25, Francis-st., Tottenham-court-road, W.C.
6 and 8 oz., any shape, plain, or graduated } clear { 8s. per gross.
3 and 4 oz. ditto ditto } blue tinted { 7s. 6d. do.
½ oz. Moulded Phials } of a very { 4s. 6d. do.
1 oz. ditto } superior { 5s. 6d. do.
1½ oz. ditto } quality. { 6s. 0d. do.
2 oz. ditto } 7s. 0d. do.
A remittance not required till the goods are received. Packages free. Delivered free within seven miles. Post-office Orders payable to “S. Isaacs and Son,” at Tottenham-court-road. Bankers: Unity Bank.

Great Reduction in the Prices of New

MEDICAL GLASS BOTTLES and PHIALS, at the Islington Glass Bottle Works, Islington-place, Park-road. London Warehouses, 19, Bread-street-hill, near Thames-street, City, E.C., and 2, Upper Copenhagen-street, Barnsbury-road, Islington. E. and H. HARRIS and CO. Proprietors.

6 & 8 oz., any shape, plain or graduated } clear { 8s. per gross.
3 & 4 oz. do. do. } blue tinted { 7s. 6d. do.
½ oz. white moulded phials } of a very { 4s. 6d. do.
1 oz. do. } superior { 5s. 6d. do.
1½ oz. do. } quality. { 6s. 0d. do.
2 oz. do. } 7s. 0d. do.

Immediate attention to country orders. No remittance required until the goods are received. Packages free. Goods delivered free within 7 miles. Post-office orders made payable to E. and H. HARRIS and Co., at the Chief Office, London. Bankers: Union Bank of London.

N.B.—Orders sent to either Establishment will have prompt attention.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on “Pepsine,” with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

Williams and Son's Pure Glycerine

SOAP. Analysed by Dr. Hofmann, F.R.S., and Professor Redwood, Ph.D., strongly recommended by many eminent members of the Medical Profession, and favourably noticed by the following Medical Journals:—

THE LANCET.
THE MEDICAL TIMES AND GAZETTE.
THE BRITISH MEDICAL JOURNAL.
THE MEDICAL CIRCULAR.
EDINBURGH MEDICAL JOURNAL.
THE DUBLIN HOSPITAL GAZETTE.

It is suited to all cases of delicate skin (whether arising from disease or otherwise), and is admirably adapted for nursery use. May be had of all respectable Chemists, Perfumers, etc.

SOAP-WORKS, CLERKENWELL, LONDON, E.C.

Superphosphate of Iron and Super-

PHOSPHATE OF IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

Mr. Jones' Elastic Uterine Truss.—

This Truss combines in its construction strength, lightness, and elasticity, is easy to wear, and efficient in its application. It affords great relief in cases of Uterine Pain, often occurring from relaxation in delicate females, and is of inestimable value in all cases of Prolapsus Uteri, rendering the use of pessaries entirely unnecessary.

N.B. Apply to the Inventor, Mr. Jones, Surgeon, 43, Friargate, Derby, or to Messrs. Longdon and Co., Wholesale Manufacturers, Derby.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

Crosse and Blackwell, Purveyors in

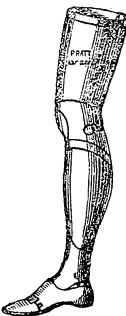

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Calf's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of CROSSE and BLACKWELL, 21, Soho-square.

Human Osteology from France,

RAGINEL, 38, Ludgate-hill, City, E.C., London. Patronised by the Royal College of Surgeons of England. Illustrated Osteology on the bones themselves. Very large Stock on the lowest possible terms. Disarticulated Skulls, in twenty-two pieces, in box. All the bones of the disarticulated skulls will be fitted in right order in the presence of the purchaser so as to shew that every bone of each set belongs to the same Skull; it will be the same for all other disarticulated pieces. Skulls with Sections. Hands and Feet on catgut. Disarticulated Skeletons, quite complete, with the Skull same body. Articulated Male Skeletons, the bones very well marked. STUDENT'S CASE OF OSTEOLOGY, COMPLETE.

Splendid Pieces for Lecturers and Museums.

Pratt's Artificial Leg.

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

“Somerset,

June 20th, 1858.

“DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,

J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street.”

Brown & Polson's Patent Corn Flour,

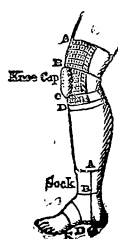

preferred to the best Arrowroot. DELICIOUS in PUDDINGS, CUSTARDS, BLANCMANGE, CAKE, &c., and especially suited to the delicacy of CHILDREN and INVALIDS.

The Lancet states—“This is superior to anything of the kind known.”

Clerical, Medical, and General Life

ASSURANCE SOCIETY.
13, ST. JAMES'S SQUARE, LONDON.

ESTABLISHED 1824.
EMPOWERED BY SPECIAL ACT OF PARLIAMENT.

DIRECTORS.

Chairman—Joseph Henry Green, Esq., D.C.L., F.R.S.

Deputy Chairmen—{ Right Hon. J. R. Mowbray, M.P.
William Bowman, Esq., F.R.S.

Patrick Black, M.D. Rev. John E. Kempe, M.A.
Sir B. C. Brodie, Bt., D.C.L., F.R.S. Rd. Howson Lamb, Esq.
Rev. Thomas Dale, M.A. Gerard W. Lydekker, Esq.
Thomas Davis, Esq. Andrew A. Miville, Esq.
Charles M. Deane, Esq. Rev. Joseph Moore, M.A.
James Dunlap, M.D. George Norman, Esq.
Clement Hue, M.D. George H. Pinckard, Esq.

REPORT PRESENTED AT THE ANNUAL GENERAL MEETING, HELD NOVEMBER 25TH, 1859.

The Directors have the pleasure to report, that during the year ending June 30th last, 451 Policies were granted, covering Assurances for £235,395, and producing in Annual Premiums £7793.

The Income of the year was £179,119; £127,601 having been derived from Premiums, and £51,518 from Interest on Investments.

After the payment of £86,581 for Claims by Death and for Bonuses,—the return of £9391 for the surrender of Policies,—and the liquidation of charges and expenses of every kind, the sum of £64,790 was carried to the Consolidated or Assurance Fund, thereby increasing that Fund to £1,255,531.

On several occasions the Directors have drawn attention to the large sums that have been laid by within the year, and they cannot now refrain from giving prominence to a feature of such great importance. The aggregate of the accumulations, during the three years which have elapsed of the current quinquennial period, amounts to £201,899; while that of the corresponding three years of the period which preceded the last division was £149,487, being an increase of £52,412.

This result appears to the Directors highly satisfactory, both as indicating the continued prosperity of the Office, and as fully justifying the expectation that the future Bonuses will be such as to sustain the reputation of the Society, and to strengthen the confidence of the Assured.

The following are some of the distinctive features of the Society:—

One half of the Annual Premiums on Policies for the whole of life may for the first five years remain on credit, and may either continue as a debt on the Policy, or be paid off at any time.

Policies for Terms of Years may be effected at rates peculiarly favourable to Assurers.

Invalid Lives may be assured at Premiums proportioned to the increased risk.

Policies participate in the Profits in proportion to the number and amount of the Premiums paid between every division. The books close for the next Bonus on the 30th June, 1861; and persons who effect policies before the 30th June next will be entitled to one year's additional share of Profits over later Assurers.

Six Bonuses have been declared; at the last, in January, 1857, the sum of £232,497 was added to the Policies, producing a Reversionary Bonus averaging 46 per cent., or varying, with the different ages, from 31 to 85 per cent. on the Premiums received since June, 1851.—The Cash Bonus averaged 27 per cent. on the Premiums received during the same period. The future bonuses may be taken in Cash, or otherwise applied at the option of the Assured.

Service in any Volunteer Corps allowed within the United Kingdom without the payment of any extra premium.

Forms of proposal, and every information, can be obtained of any of the Society's Agents, or of

GEORGE CUTCLIFFE, Actuary and Secretary,
13, St. James's-square, London, S.W.

N.B.—A Fee of One Guinea is paid to the Medical Attendants of all persons proposing to assure.

MUTUAL LIFE ASSURANCE.

Scottish Equitable Life Assurance

SOCIETY. INSTITUTED 1831.

HEAD OFFICE:—26, ST. ANDREW-SQUARE, EDINBURGH.

The Profits are divided every three years, and wholly belong to the members of the Society. The last division took place at 1st March, 1859, and from the results of it is taken the following

EXAMPLE OF ADDITIONS.

A POLICY FOR £1000, DATED 1st MARCH, 1832, is now increased to £1654 9s. 5d. Supposing the age of the Assured at the date of entry to have been 40, these Additions may be surrendered to the Society for a present payment of £363 17s. 8d., or such surrender would not only redeem the entire premium on the Policy, but also entitle the party to a present payment of £104 4s., and, in both cases, the Policy would receive future triennial additions.

THE EXISTING ASSURANCES AMOUNT TO .. £5,272,367

THE ANNUAL REVENUE .. £187,240

THE ACCUMULATED FUND (arising solely from the

Contributions of Members) .. £1,194,657

53 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

Health, Fresh Air, and Pure Water.

—By Her Majesty's Letters Patent.—CONDY'S FLUID contains NASCENT OXYGEN, nature's true and only purifying agent; instantly removes all offensive smells; renders impure water fresh, and the air pure; when diluted for use, is of a beautiful colour, not soiling the finest linen; is harmless, and particularly adapted for toilet use, being both refreshing and exhilarating. The Medical Profession have expressed their unqualified approbation of its merits. One gallon makes 200 gallons adapted for use. The cooling, healing, gently stimulating and invigorating properties of this Fluid render it, when diluted, a lotion possessing peculiar and valuable characteristics, whether for bathing the bodies of invalids, incorporating in poultices, or washing and healing wounds. Patronised by the Board of Health, and most public departments, hospitals, schools, and adopted by the India Council in preference to all other disinfectants. In bottles, 6d. 1s. and 2s.; stronger and purer, 1s. 2s. and 4s.

CONDY'S PATENT HEALTH POWDER also contains NASCENT OXYGEN, is odourless, and destroys all smells; in bottles, 1s. 6d. and 3s., and in casks of 1 cwt. 36s.—Wholesale agents, John Bell and Co. chemists, No. 338, Oxford-st. W.; Butler and Crisp, 5, Cheapside, St. Paul's; Ferris and Co., Bristol.—Chemical Works, Battersea, S.W.

To Surgeons, Dentists, etc.—The Best

HOUSE in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard House, 78, Farringdon-street, City.

Established upwards of a Century.

A large Stock of New Instruments always on Sale, all Warranted.

Instruments Bought, Sold, or Exchanged.

N.B.—The largest Stock of Second-hand Dissecting Cases in London.

Ford's Eider-Down Jackets for Invalid

LADIES, Young Persons of Delicate Constitution, and all who suffer from cold, to whom they are a great comfort. No other article is so light and warm; it is, therefore, a desideratum to ladies recovering from illness, as also to those used to hot climates, while for travelling or wear in the carriage during cold weather it is indispensable. Superfine cloth or Cashmere lined Silk, Eider-down quilted, price Two Guineas. Sent, post free, on receipt of Post-office order and the size round chest under arms.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Ford's Aixa Jackets, with sleeves

à la Zouave, open to the corsage, may be had plain or beautifully embroidered; price in cloth, 21s.; Velvet, 42s. and 63s. The half-guinea cloth Jacket, for in or out-door wear, surprises every one for cheapness and style. Patterns and Pictures of any of the above sent free to all parts of the world.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Bass's East India Pale Ale.—The

OCTOBER BREWINGS of this Celebrated Ale, and the MILD BURTON ALES are now arriving in casks of eighteen gallons and upwards. Our stock of Ale in bottle is in good condition. Barclay's Porter and Stouts, in bottle and cask, may also be had of

BERRY, BROS. and CO. 3, St. James's-street, London.

Carriages, New and Second-hand, of

superior style, sterling quality, and finest finish at reasonable rates for cash, credit, job, or exchange. Circular of prices on application Credit given when required. Buyers should take carriages on trial, with power to purchase by yearly payments, and thus prove them.

OFFORD'S PATENT MEDICAL MAN'S BROUGHAM MANUFACTORY, 79, WELLS-STREET, OXFORD-STREET.

Mr. Howard, Surgeon-Dentist, 52,

FLEET-STREET, has introduced an entirely NEW DESCRIPTION OF ARTIFICIAL TEETH, fixed without Springs, Wires, or Ligatures. They so perfectly resemble the natural teeth as not to be distinguished from the original by the closest observer; they will NEVER CHANGE COLOUR or DECAY, and will be found very superior to any teeth ever before used. This method does not require the extraction of roots, or any painful operation, and will give support and preserve teeth that are loose, and is guaranteed to restore articulation and mastication: and that Mr. Howard's improvements may be within the reach of the most economical, he has fixed his charges at the lowest scale possible. Decayed Teeth stopped and rendered sound and useful in mastication. 52, Fleet-street. At home from Ten till Five.

Best Iron Wire, prepared expressly by

COCKER BROTHERS, NURSERY-STREET, SHEFFIELD, for SURGICAL PURPOSES, as supplied to Professor Simpson, Edinburgh, Dr. Churchill, Dublin; Mr. T. Spencer Wells, London; Dr. Bozeman, Montgomery, U.S.; and many others.—See Professor Simpson's Lecture; Medical Times, January 1st, 1859.

MEDICAL AGENCY.

NOTICE OF REMOVAL AND CHANGE OF FIRM.

Mr. Lara (for the last eight years the sole representative of LANE and LARA, Medical Agents and Arbitrators and Lunatic Asylum Registrars,) begs to inform the Profession that, in consequence of the daily increasing support with which he has been favoured, and for which he tenders his sincerest thanks and acknowledgments, he has taken into PARTNERSHIP Mr. James Maxfield Walters, a gentleman who has had considerable experience in the business. It will, therefore, from and after Christmas, 1858, be carried on, under the Firm of LARA and WALTERS, at 6, PUMP-COURT, Middle Temple, E.C., whither they have removed their Offices from 22, Buckingham-street, Adelphi, in order to provide that larger accommodation which a constant intercourse with a great majority of the entire body of General Practitioners in England has rendered necessary.

Partnerships and Practices sold and valued: Asylums transferred: Arbitrations effected: Assistants provided (if for a permanence without charge to Employers): and every other description of business transacted for the Profession at a fixed and moderate cost. Attendance from 11 till 4.

Medical Registration Office.

32, SOHO-SQUARE, LONDON, W.
NOTICE.—The Copy of the MEDICAL REGISTER, to be printed and published in 1860, as directed by the 27th Section of the Act—will contain those Names only which appear on the General Register, as existing on the 1st day of January, 1860.
November 21, 1859.

King's College, London.—The Council

are ready to receive Applications from Candidates for Two Appointments of ASSISTANT-PHYSICIAN for DISEASES OF WOMEN and CHILDREN, at King's College Hospital. For particulars apply to
Dec. 19, 1859. J. W. CUNNINGHAM, Secretary.

Insanity, Nervous Debility, &c.—The

Medical Profession can be immediately supplied with Attendants, Male or Female, of skill, experience, and respectability, on application to S. BROOKES, Chemist, 62, Lisson Grove, Marylebone.

Wanted, by a Medical Practitioner

in a Provincial Town, fifty miles from London, a QUALIFIED ASSISTANT, to visit and do part of the Dispensing. A light weight, and accustomed to horse-back indispensable. Apply to Warner and Barclay, 55, Fore-street, Finsbury.

General Practice.—To be disposed of,

with immediate possession, in consequence of ill health of the present proprietor, a genteel, almost unopposed, and old established COUNTRY PRACTICE in Suffolk. A Union Appointment. No Clubs. Present receipts about £600 per annum, capable in active hands of considerable extension. For terms apply by letter to H., Post Office, Halstead, Essex.

Royal London Ophthalmic Hospital,

BLOMFIELD-STREET, MOORFIELDS.
A Three Months' COURSE OF LECTURES ON OPHTHALMIC SURGERY, in compliance with the recent Regulations of the Army Medical Department, will be given at this Hospital by Messrs. CRITCHETT and BOWMAN. The Lectures will commence on January 10, at Half-past Ten o'clock, and be delivered every Tuesday and Friday at this hour. Fee for One Year's Hospital Attendance, including Lectures, Five Guineas. Students already entered will be admitted without further fee. Medical Men in the public service will be admitted on presenting their cards.

Edwin Cottingham, Deceased.—

Pursuant to the Act of Parliament of the 22nd and 23rd Vict., cap. xxxv., entitled "An Act to further amend the Law of Property, and to Relieve Trustees," all Creditors and other persons having claims against the estate of Edwin Cottingham, late of Bexley, in the county of Kent, Surgeon, deceased, who died at Bexley aforesaid, on the 28th day of November, 1858, are hereby required to send in their claims to James Thomas Cookney, of No. 11, Bolton-row, Piccadilly, London, gentleman, the executor of the deceased; or to us, his Solicitors, at our Chambers, No. 17, Lincoln's-inn-fields, in the county of Middlesex, on or before the 16th day of February, 1860; at the expiration of which time the Executor will proceed to distribute the assets of the said Edwin Cottingham among the parties entitled thereto, having regard only to the claims of which the Executor shall then have had notice, and will not be liable for the Assets so distributed to any person of whose claim he shall not have had notice at the time of such distribution. Dated this 14th day of December, 1859.
MASON and WITHELL,
17, Lincoln's-inn-fields. Solicitors to the Executor.

"PULVIS JACOBI VER., NEWBERRY'S."

Diphtheria, Fevers, Hooping Cough,

&c.—We beg to caution the Profession against imitations of this invaluable Medicine, for so many years prescribed as "Pulvis Jacobi Ver." but to which it is now necessary to add the name "NEWBERRY'S," to secure prescribers against the SUBSTITUTION of articles advertised as James' Powder, BUT WHICH HAVE NOTHING IN CHARACTER, DOSE, OR EFFECT, with the original article, which has been sold by the Newbery Family continuously since its introduction in 1746.

Price, for dispensing: 1 oz. bottles, 9s.; ½ oz. do. 3s. 4d.
45, St. Paul's-churchyard, London. (Signed) F. NEWBERRY & SON.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

To Medical Assistants.—Wanted, a

GENTLEMAN with an English Qualification, who can be well recommended, for an ASSISTANCY within five miles of Charing-Cross. Salary, £50 with board, &c. Apply personally, to Mr. Orridge, 30, Bucklersbury.

Medical.—The impaired health of a

Gentleman conducting a valuable and extensive PRACTICE within easy reach of the Metropolis, in an eligible rural district, renders an early arrangement for the succession desirable. An effective introduction can be given. The receipts are about £1000 yearly. Entrance £1000. Apply at Mr. Orridge's Offices, 30, Bucklersbury.

Medical.—A Partnership or Succession

to a highly select PRACTICE, in a first-class neighbourhood in the suburbs of London, to be DISPOSED of. Apply to Messrs. Hilton and Co., 8, Upper Thames-street, E.C.

Diabetes and Consumption.—Gluten

BREAD, so strongly recommended to be used in place of ordinary Bread by those suffering from the above Diseases, can be obtained only of G. VAN ABBOTT, 13, BASINGHALL-STREET, E.C., from whom copies of Testimonials by eminent Practitioners in London and Paris can be had on application, in Boxes 5s. each, forwarded to any part of the Kingdom, on receipt of Post-office order.

CAUTION.

Chlorodyne.—Any Preparation adver-

tised or sold under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals.

Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to

J. T. DAVENPORT, Pharmacist, 33, Great Russell-street, Bloomsbury, London.

N.B.—Medical men are earnestly solicited to attach the words "Dr. J. Collis Browne's Chlorodyne" when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.

The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner are at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

BASTICK'S OLEO CUBEbine.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebene and the essential oilen their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

H. Silverlock's Medical Label Ware-

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

London: Printed by CHARLES REED and BENJAMIN PARDON, of 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and Published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—December 24, 1859.

Notice to the Medical Profession, and

Professors of Music, Drawing, Dancing, and other Arts and Sciences. LETTS'S APPOINTMENT DIARY is a most complete, unpretending little Pocket-book, whose pages are not only apportioned to the days of the year, but to the several working hours of each, so that a perfect division of time may be ensured, and at any time consulted at a glance. Sold by all Booksellers. 2s. 6d. each. Catalogues Gratis.

LETTS, SON, and Co., 8, Royal Exchange, London, E.C.

Ford's Eider-Down Jackets for Invalid

LADIES, Young Persons of Delicate Constitution, and all who suffer from cold, to whom they are a great comfort. No other article is so light and warm; it is, therefore, a desideratum to ladies recovering from illness, as also to those used to hot climates, while for travelling or wear in the carriage during cold weather it is indispensable. Superfine cloth or Cashmere lined Silk, Eider-down quilted, price Two Guineas. Sent, post free, on receipt of Post-office order and the size round chest under arms.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

Ford's Aixa Jackets, with sleeves

à la Zouave, open to the corsage, may be had plain or beautifully embroidered; price in cloth, 21s.; Velvet, 42s. and 63s. The half-guinea cloth Jacket, for in or out-door wear, surprises every one for cheapness and style. Patterns and Pictures of any of the above sent free to all parts of the world.

THOMAS FORD, Mantle Rooms, 42, Oxford-street, London, W.

W and A. Gilbey, Wine and Spirit

IMPORTERS and DISTILLERS, are now doing by far the largest trade of any other house in the Kingdom, their connexion exceeding at the present time 15,000 private families and more than 50 of the most important Hospitals, Military Messes, and Public Institutions; they beg to offer the following advantages to consumers.

WINES FROM THE CAPE OF GOOD HOPE.

PORT, SHERRY, MADEIRA, MARSALA, all First Growths, 20s. per dozen, £3 6s. 6d. per 7-gallon cask, £6 11s. 3d. per 14-gallon cask, and £12 19s. per quarter-cask of 28 gallons.

They are pure, delicate, wholesome, and in every way suitable for either dinner or dessert.

The Custom House Returns for 1858 show that W. and A. G. paid duty on the unprecedented quantity of 56,635 gallons of these wines alone in that year.

WINES FROM PORTUGAL.

Fine Old PORT from the Wood 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

This, our leading article from Oporto is the old school of mature silky Port from the wood, with body and bouquet. This is more palatable and wholesome than those extremely high-priced old Bottled Wines, which have nothing left to recommend them but vegetable decay.

WINES FROM SPAIN.

SHERRIES, Pale and Golden, at 36s. per dozen, £5 19s. per cask of 7 gallons, £11 14s. per cask of 14 gallons, and £23 2s. per cask of 28 gallons.

The almost total disappearance of the Vine Disease in Spain, enables us to import an extremely good wine at this price; it is a decided improvement on former shipments.

WINES FROM FRANCE.

CLARETS at 24s. and 38s per dozen. These, our leading importations of *Vin Ordinaire*, are superior to those generally drunk in France, and we guarantee them decidedly superior to any other offered at anything like these prices. They are shipped to us direct from the vineyards, under the superintendence of one of the leading Bordeaux Houses.

CHAMPAGNE, 37s. 6d. per dozen. Having made a large contract to have this wine shipped direct from the vineyards, we are enabled to submit it not only as the cheapest imported, but as good as any gentleman can desire to have on his table.

WINES FROM SICILY.

MARSALA, 24s. per dozen, £4 0s. 6d. per 7-gallon cask, £7 19s. per 14-gallon cask, and £12 7s. 6d. per quarter cask of 22 gallons.

This is Ingham's superior, and is often preferred to even middling-class Sherries, and the quality is guaranteed.

SPIRITS.

COGNAC BRANDY, finest	25s. per gallon.
GIN, the old English	11s. "
WHISKEY, Pure Old Irish	10s. "
" " Old Scotch	10s. "
RUM, Old Jamaica	14s. "

A dozen full-sized bottles of any of the above Wines at the quoted prices, or for 5s. in stamps a dozen small samples, or any two samples for 12 stamps, sent securely packed and labelled.

A detailed Price-List of other Wines, Spirits, and Liqueurs sent on application.

In England Cheques to be crossed to our Bankers, the Bank of England, and Post-office Orders made payable to the General Post-office, London; in Ireland the Bank of Ireland, and General Post-office, Dublin; in Scotland the Bank of Scotland, and General Post-office, Edinburgh.

W. and A. GILBEY, 357, Oxford-street, London; 31, Upper Sackville-street, Dublin; 12, St. Andrew's-square, Edinburgh.

Burrows and Co., Wholesale Wine

MERCHANTS, LIVERPOOL.

STORES—LIME-STREET. OFFICES—54, DUKE-STREET.

The Proprietors beg most respectfully to call the attention of the Trade, Noblemen, Clergy, and the Public in general, to their extensive stock of Choice Wines of rare Vintages.

B. and Co. are not disposed to comment upon the purity of their Wines which is daily most laudably acknowledged by the Public, and eminent Medical Men of all countries, as the increasing patronage of the highest families in the land is a sufficient guarantee.

They beg to call particular attention to their Pure Tonic Wines, as being so valuable to Invalids, and persons of weak stomachs.

A Sample Case, containing three full sized Wine-bottles, will be forwarded to any address, on receipt of Post-office Order for 6s. 6d., or a dozen for 24s.

It is a well-known fact that impure and adulterated Wines are the greatest foes to health, producing acidity in the stomach, and debilitating the digestive organs, while pure Wines will accelerate the digestive powers, invigorating, strengthening, and bracing the nervous system.

Their Tonic Wine is admitted to be most essential to Invalids both old and young, and should never be absent from the homes of the weak and sickly. Its properties are clearly acknowledged and appreciated by the leading men of the Faculty, both at home and abroad.

To prevent imposition, each bottle is sealed with the name of the firm. All orders to be made payable to Henry Burrows.

Pepsine.—M. Boudault begs to state

that he cannot be answerable for the purity and strength of any Preparation sold under his name unless obtained from his sole Agent, Mr. PETER SQUIRE, Her Majesty's Chemist, 277, Oxford-street, London, to whom all applications respecting it must be addressed.

Second Edition of Boudault on "Pepsine," with Remarks by English Physicians. Edited by W. S. SQUIRE, Ph. D., published by J. Churchill, London, may be also had of the Author, 277, Oxford-street, price Sixpence.

THE DISEASES OF WOMEN.

By J. Y. SIMPSON, M.D. F.R.S.E.

Professor of Medicine and Midwifery in the University of Edinburgh.

LECTURE XXVI.

ON OVARIAN DROPSY.—ITS SURGICAL TREATMENT.

GENTLEMEN,—Great diversities of opinion have prevailed with respect to the proper principles on which the Surgical treatment of cystic or dropsical tumours of the ovary ought to be conducted; many methods of Surgical treatment have been proposed; and some authorities have doubted the propriety of all Surgical interference whatever. It would be almost an endless, and, withal, a very profitless task, were I to dwell upon all the details of the different modes of Surgical practice that have been resorted to in the treatment of ovarian dropsies. You will be better able to undertake the management of a case when it comes under your own observation, if I now endeavour to point out and illustrate the general principles which must be followed in the treatment of the malady. But let me premise a hope that in the course of a few years—especially as the attention of the Profession is now strongly directed to the subject—we may yet see all the means of its Surgical treatment still more systematised and reduced to order than they have ever yet been, for then only shall we be able duly to appreciate each, and to know in what case to adopt or in what to reject it.

Of all the Surgical means, then, by which it has been attempted to reduce and keep reduced, an ovarian tumour, perhaps the simplest is

I. THE APPLICATION OF PRESSURE.

Mr. Benjamin Bell, and Dr. Hamilton, of this city, tried, long ago, to dispel ovarian tumours by means of pressure; and in later years this plan of treatment has been revived by Mr. Baker Brown, who has carried it out much more perseveringly and systematically, and, it is reported, with better success. On what principle, some of you may ask, could we ever hope to arrest the growth, or bring about the resorption of cystic ovarian tumours by the application of pressure? I have already tried to show you that such tumours tend to develop themselves chiefly in the direction in which they meet with least resistance to their increase and growth, and it was supposed that by presenting an adequate obstacle to the growth of the tumour towards the abdominal cavity as persistent and effectual as that which it naturally meets with in the hard-walled cavity of the pelvis, the further progress of the growth might be stayed, and, perhaps, even a certain degree of diminution produced in the size of the tumour. The same principle of treatment has been applied to other forms of morbid growths also, by Recamier, Arnott, Young, and others. It has been attempted in this way, for example, to check the growth of cancerous tumours, and to bring about their destruction, by subjecting them to such a degree of pressure as would hinder the further development of the individual component cells of the compressed mass, or lead to their speedy dissolution and decay. This kind of treatment was carried out long and perseveringly, and in many different ways; but all hope of curing cancer in this way has now, I believe, been given up; and, I believe, that for the cure of ovarian tumours, too, such treatment is almost equally hopeless. Compression of ovarian tumours was effected by means of books, metallic presses, or folds of lint and linen cloth, laced and tied over the abdomen by all kinds of bandages. The application of the compressing agent was sometimes preceded by a preliminary tapping, with the view of preventing a re-accumulation of the fluid in the interior of an evacuated cyst, and, with some hope also, of producing the cohesion of its collapsed walls. I have known cases where this treatment has been tried, and have been told

by the patients subjected to it that the amount of pain and distress produced by it was almost intolerable. If you inquire with what degree of success this plan of treatment has been attended, I think you will find it but very slight; and I believe the very few and isolated cases of cure that have been reported as probably or possibly resulting from it will hardly induce you to submit any of your patients to such an irksome and painful process.

II. PARACENTESIS.

The oldest practice, and that which is still most frequently had recourse to in the treatment of cystic tumours of the ovary, is the removal of the fluid from the largest and most prominent cyst or cysts by tapping them with a trocar and canula, or even by means of a simple knife or lancet. Various questions at once present themselves in connection with this mode of treatment. Let us see, first of all, under what circumstances we ought to puncture an ovarian cyst—or, in other words, let us study

1. *The Cases requiring the Operation.*—In Britain the operation of paracentesis abdominis is, as a rule, almost never had recourse to, till the ovarian tumour has attained such a size that it compresses injuriously the abdominal organs, and interferes with their function, or even impedes the action of the diaphragm, and renders respiration difficult, so that the patient is subjected to much discomfort and suffering, her health, perhaps already damaged and impaired, and, it may be, even her life itself is endangered by the distension to which she is subjected. Some writers have attempted to determine and define in what particular cases and conditions the operation should be performed; but, whatever rules you may find laid down regarding it, I repeat, that when you come to practice you will usually find that the degree of distress which the patient is suffering, or the degree of danger to which her health or life is exposed, are the indications that guide and impel you to the performance of the operations. Having decided as to the necessity of the operation in any particular case, you have next to determine where the tapping should be made; or

2. *The Place of Puncture.*—The puncturing instrument is usually introduced in the linea alba a few inches below the umbilicus, at about the upper third of the distance between the umbilicus and the symphysis pubis, because in most cases the cyst is in this locality sufficiently prominent to be easily pierced, and there are no vessels of any consequence in the abdominal wall which are likely to be a source of hæmorrhage, if they should happen to be injured by the trocar or lancet. I don't very well know for what reason, some Surgeons have proposed to evacuate ovarian cysts by puncturing them through the bladder. I can easily see that there might be a good deal of danger attendant on such a proceeding, but what advantage it could have over other and safer forms of the operation I do not understand. I have sometimes tapped ovarian dropsies at other points of the abdominal walls, as in the middle line above the umbilicus, or in one of the lineæ semicirculares below it; and we are obliged to select these or other spots in those exceptional cases where the cystic mass is too dense at the usual site for abdominal paracentesis, or where the trocar and canula have failed to draw off any sufficient amount of fluid when introduced in the usual position of the linea alba. If the subcutaneous veins are much increased in size,—as they often are vicariously in ovarian dropsies which are large enough to compress the vena cava inferior,—be very careful and choose for the insertion of your trocar a spot which presents no enlarged veins beneath the skin. But in tapping ovarian dropsies the abdominal parietes have not always been selected as the seat of puncture. Sometimes they have been tapped through the vagina and the bladder; and I have read of the proposition of tapping also ovarian cysts through the rectum. The primary objection to performing the operation, as a common rule, through any such dependent localities is simply this,—the denser portion of multilocular ovarian tumours is, as I have already explained to you, almost always placed inferiorly in the cavity or at the brim of the pelvis, and we cannot usually easily or at all reach the larger cyst or cysts of the tumour by entering the canula from below. In some exceptional cases, however, we can readily enough empty the tumour in this way; and if we can there is no valid objection to performing paracentesis, as Nonat, Naumann, Watson, Arnott, Ogden, and others have done, by puncturing the dropsical collection through the roof of the vagina.

3. *Results of the Operation.*—If you ask What results are to be expected from this operation, and with what hope of cure may it be undertaken? I must at once tell you that the hopes of an ultimate and complete cure by means of it are very faint and slight indeed; and that it is usually had recourse to only as a means of temporary palliation. It has happened comparatively but very rarely that the simple tapping of a cystic ovarian tumour has been followed by a final cure of the disease. In ninety-nine cases out of a hundred, where the patient survives the first tapping, the operation requires to be repeated again and again; and every time it is had recourse to the interval, as a general law, becomes shorter and shorter between every two successive tapplings. Sometimes women have survived for many years a series of tapplings, and enormous quantities of fluid have, in such cases, been drawn off from the cysts, as the following table shows:—

TABLE OF OVARIAN TAPPINGS, ETC.

Cases.	Number of Tappings, etc.	Quantity of Contents.
Lady Paget (Dr. Mead)	67 in 5 years.	240 gallons.
Mr. Ford's case	40.	350 "
Ramabotham's	129 in 8 years.	461 "
Morand	in 10 months.	427 "
Martineau, of Norwich.....	80 in 25 years.	729 "

The table shows you, I repeat, the frequency with which the operation of tapping has been repeated in a few of the more rare and remarkable cases that have been put on record, and the large quantity of fluid that has been abstracted in each case in the course of these oft-repeated evacuations. Sometimes you may possibly meet with a case where the patient does not succumb until after the lapse of many years, and after the operation has been very frequently repeated. But that is certainly not at all the history of the ordinary run of instances of ovarian dropsy, for the patient usually dies after the operation has been only a few times performed. Let us ask, then,

IS TAPPING A DANGEROUS OPERATION?

I believe it is by no means free from danger, more especially when performed for the first time. I have just told you that in some instances the operation has been repeated a great many times upon the same woman with the most perfect impunity, and the observation of cases of this kind where patients have been thus frequently tapped, may have led to the conviction impressed on many Professional minds that the operation is as safe as it is simple and easy of performance. But that the operation is not so simple and harmless as it appears, some of you have had an opportunity of seeing in the case of a patient who died in the Hospital in the early part of the year. I doubt not some of you will be able to recal to memory the patient I refer to. She was suffering from a large encysted tumour of the ovary, the great bulk of the disease being produced by the excessive development of a single cyst, which I tapped with the ordinary trocar and canula. The operation must have appeared to you a very simple one; there was no kind of complication or peculiarity about it; and certainly we were but little apprehensive of danger at the time. But in a day or two, inflammation sprang up in the interior of the evacuated cyst, and the patient died of a form of Surgical fever. About the time when that fatal case occurred in the Hospital, I saw, along with Dr. Coldstream, another instance of the disease in the person of a young unmarried lady, who had, when in England, consulted Dr. Clay as to the propriety of ovariectomy. Before, however, finally determining on that point, or on the injection of iodine, or other special measure, we agreed to make one preliminary tapping, to see what might be the nature of the contained fluid; whether there were any adhesions, and what, in short, were the exact characters, relations, and conditions of the tumour, as far as they could be ascertained, after the evacuation of the principal cyst. A quantity of pale bland-looking fluid escaped, and there was nothing noticed at the time in connection with the case to make us apprehensive of the result. But, as in the other case, the lining membrane of the cyst inflamed, and the patient died. Two cases of this kind, occur-

ring so nearly at the same time, serve to remind us very forcibly of what we so readily forget in the midst of the ordinary run of successful—or, at least, innocuous—cases of the operation, viz., that simple tapping of a cystic ovarian tumour may sometimes be fatal. In these two instances, the patients were both operated on for the first time; and I mention this circumstance in order to impress it more emphatically upon you, that the operation is chiefly dangerous when the cyst is for the first time evacuated. When once a patient has been subjected to the operation successfully, or, at least, without undergoing any special hazard, she is comparatively safe, and the operation may be repeated as often as the urgency of her symptoms require it without the same degree of fear of a fatal issue. When a tapping is performed for the second, third, or fourth time, it seldom by itself proves fatal; for when the patient survives the first operation, it is not until she has become exhausted by the successive accumulations and repeated evacuations of the fluid that she finally sinks from gradual exhaustion and irritative fever which succeeds the series of operations. Thus, I have before me a preparation of encysted dropsy of the ovary, taken a short time ago from the body of a patient who died of that disease. The tumour had been growing for about three years, and in the month of July, of last year, it had attained such a size, and interfered so much with the patient's health, that I was obliged to tap her then, for the first time, in order to relieve her of her urgent symptoms. She got over the operation remarkably well, and enjoyed tolerable health for three or four months; but in the end of November the tapping had to be repeated, because of the great re-accumulation of the fluid and the recurrence of the symptoms. She thus again procured a temporary relief, but now of shorter duration, for in two months the tapping had to be again performed. Her recovery on this occasion was not so perfect, and when, in a few weeks afterwards, the fluid was again drawn off, it was found to be mixed with pus. From this time her health and strength rapidly declined; the paracentesis had again to be repeated three different times, and after each renewal of the operation she was found weaker than before, till at last she sank and died in rather less than a year from the time the operation had been first performed. Such a history is the common sad history of many a case of ovarian dropsy and ovarian tapping; though there are many where the progress of the disease is less rapid, and where the evacuation of the fluid requires to be effected much more frequently ere the patient finally succumbs. But all of them alike show that when the first tapping has been safely and successfully got over, the operation may usually be repeated often with less immediate danger. Why is it—you may ask,—that the operation is so much more dangerous when it is performed for the first time? It is usually supposed, and it has often been said, that tapping an ovarian cyst is a very simple operation. But in first cases, at least, it is really not so. After the operation has been once performed, you may often expect some adhesion to have taken place between the surface of the tumour and the abdominal parietes, so that the puncturing trocar most probably only penetrates these fibrous masses in future operations; while in first tapplings, or in cases where no adhesions have been formed between the tumour and the abdominal wall, the peritoneum is wounded at two points, in one or both of which inflammation may readily be set up, and whence it would speedily spread over a large extent of surface. The fluid escapes usually to some degree into the peritoneum, and all may go on safely enough if this fluid be healthy in character, and unmixed with inflammatory products. But in first cases, with the operation usually postponed as long as possible, you will not unfrequently find that the fluid that flows out is mingled with inflammatory products; and should any of this deteriorated and morbid matter escape past the canula, or through the unclosed aperture of the cyst-wall into the cavity of the peritoneum, it would be sure to light up a degree of inflammation there which might soon prove fatal. We have not very many statistics relating to this subject, but I show you here a Table, from which you can learn both how frequently ovarian tapping proves fatal after its first performance, and how very speedily in the majority of cases the disease hurries on to a fatal termination after the practice of tapping the cyst is once begun. The table is drawn from an Essay by Dr. Fock, published at Berlin in 1856. Several of the patients were tapped many times. The Table shows merely the

DATE OF DEATH OF THE PATIENTS AFTER FIRST TAPPING IN
132 CASES OF OVARIAN DROPSY.

25	died within some hours or a few days,
24	" " six months,
22	" " the first year,
21	" " the second year,
11	" " the third year.
29	only were alive at end of last date.

132

The mortality from firstappings, or, in other words, the proportion of the 132 patients that died within a few hours, or a few days at most, after the operation was performed for the first time, was 1 in every 6. Professor Kiwisch, of Wurzburg, lost 9 patients out of 64, or about 1 in every 7, within twenty-four hours after their first tapping for ovarian dropsy. Several years ago Mr. Southam, of Manchester, published a table from different sources of the results of 20 cases of ovarian dropsy treated by paracentesis. Of these 20, 4 died within a few hours after the first tapping; 3 within the first month; 14 in all within nine months. Of the remaining 6, 2 died in eighteen months, and 4 lived from periods varying from four to nine years. Dr. Meigs, of Philadelphia, speaks of his impression being that among the firstappings of ovarian dropsy which he has witnessed during his long and useful Professional life, nearly one-half have been speedily followed by the death of the subject from peritonitis, developed soon after the performance of the operation. This mortality is certainly much larger than the average. But I have said enough to make you cautious and careful in regard to your prognosis in reference to tapping an ovary for the first time. In short, all experience and all statistical records go to show that the operation of tapping for cystic disease of the ovary is not always a safe operation, that it is not usually a satisfactory one, and that it very seldom proves successful. It is very rarely, indeed, that it ever produces a cure; at the best it is usually only a temporary palliative, relieving the patient from symptoms very distressing and immediately dangerous. But after a longer or shorter period the symptoms of distress and danger thus abated and averted are almost sure to return and call for a renewal of the operation; and so the case goes on with intervals of relief following the repeatedly-performed operation, but growing always shorter and shorter till finally the patient gets worn out and dies.

I shall continue my remarks on the Surgical Treatment of Ovarian Disease in my next lecture.

ORIGINAL COMMUNICATIONS

THE

ANTIPHLOGISTIC POWERS OF MORPHIA

ILLUSTRATED BY ITS USE IN THE

TREATMENT OF ACUTE INFLAMMATIONS OF THE SCLEROTIC

AND IRIS.

By J. ZACHARIAH LAURENCE, F.R.C.S., M.B. Lond.
Surgeon to the South London Ophthalmic Hospital.

PERHAPS the most (therapeutically) important distinction in the Ophthalmiæ is, whether the conjunctiva or the sclerotic is the part principally affected. It would be foreign to my purpose to enter into the diagnosis of these two classes of inflammations. The most practical difference is in the nature of the pain. While in the conjunctival inflammation the pain is generally less severe ("pricking or scalding"), more superficial, and referred by the patient to the eye-lids; on the other hand, the sclerotic inflammation is characterised by a generally very severe (occasionally agonising), often nocturnal pain (rendering the patient quite sleepless), of a deep-seated throbbing or dead character, and referred to the eye-ball, eye-brow, temple, and head generally. Now the acknowledged and accepted treatment of the day of these cases of scleritis and iritis consists in a selection or combination of bleeding, leeching, cupping, blistering, and mercurialisation.

I was first induced to try the effect of the morphia (in

Case 1) rather with a view of relieving the excessive pain, than from the hope of any further result; but finding, to my great surprise, that not only was the pain relieved, but the disease itself on the decline, I continued the morphia then with a view of really testing its antiphlogistic powers; and, meeting with success, have administered the same remedy in other cases with good results. Some of these cases I now submit as the evidence of the antiphlogistic powers of morphia; and, the plan of treatment being different from that generally employed, have given them with a detail I should, under other circumstances, not have entered into.

Case 1.—*Acute Scleritis—Morphia Treatment—Decline of the Disease in about Four-and-twenty Hours.*—S. S., a middle-aged woman, was admitted to the South London Ophthalmic Hospital on November 3, 1858. The sclerotic was intensely injected, the conjunctiva slightly; the "sclerotic zone" well marked. She suffered such severe shooting pain in the eye-ball, eye-brow, and infra-orbital region, as to render her quite sleepless.

November 3.—R. Morph. hydrochlor. gr. $\frac{1}{4}$, every third hour. Warm water fomentations to the eye.

6th.—Took the morphia regularly up to four p.m. yesterday, when she took the last powder. Towards the evening of the 4th the pain in the eye began to abate; now she feels but a slight aching in the eye on exposure to light. The sclerotic vascularity has considerably diminished. She now recovered rapidly under the treatment of a slight conjunctivitis.

Case 2.—*Acute Scleritis—Morphia Treatment—Decline of the Disease in less than Twelve Hours.*—H. B., an elderly, but strong man, admitted to the St. Marylebone Dispensary. July 27, 1859. Scleritis of a week's duration characterised by intense vascularity of the sclerotic, and a "sharp, burning" pain in the eye-ball and forehead, with nocturnal exacerbation, rendering the patient sleepless. Suffering simultaneously from gout in the great toe. Has done nothing but foment the eye.

R. Morph. hydrochlor. gr. $\frac{1}{2}$, 3tia. quaque horâ. Warm water fomentations to the eye.

July 29.—Has taken the medicine as prescribed. Slept well, but not heavily, on the night of the 27th after midnight, when the hitherto severe pain in the eye left him. To-day, the vascularity of the tunics greatly diminished; the pain in the eye-ball, brow, and forehead gone, leaving but a trifling pain at the side of the nose. Bowels have not acted since the 27th. To leave off the morphia and take an ounce of castor-oil.

August 1.—Perfectly recovered.

Case 3.—*Double Acute Iritis—Failure of Leeching and Mercurialisation—Morphia Treatment—Decline of Disease within Four-and-twenty Hours.*—E. P. was admitted to the South London Ophthalmic Hospital on August 27, 1859, during my absence from town, and up to September 10, when I first saw her, had been treated by leeching, blistering, mercurialisation and belladonna lotion for the previous three weeks.

September 10.—Iris discoloured; sclerotic deeply injected; pupils dilated (from the belladonna lotion); humours muddy; complains of pain in the eye-balls and eye-brows, "like a rheumatic pain, of an overwhelming weight, of the light causing her great agony;" eye-sight very dim.

R. Morph. hydrochlor. gr. $\frac{1}{2}$, 4ta. quaque horâ. Warm water fomentations to the eyes.

14th.—Took the first dose of medicine on the night of the 10th. The pain abated, and she expressly stated "very suddenly." She slept that night. On the following morning she could face the light much better. The medicine has made her feel very sick and drowsy. To-day she complains only of a little "pricking and shooting pain." Her eyes are still dim and weak, but the sclerotic injection is nearly gone.

28th.—Since the last report has been taking the morphia in diminished doses, and subsequently a grain of quinine three times a-day. Her eyes are to all appearances perfectly sound; nothing remains of her disease but a slight haziness of vision.

Case 4.—*Acute Scleritis—Morphia Treatment—Decline of the Disease in about Seven Hours.*—B. L., aged 40, a working engineer, was admitted to the South London Ophthalmic Hospital on September 24, 1859. Five or six years ago he was struck on the now inflamed eye by something from a forge-fire. He recovered from the accident in about a month. The eye has been inflamed, as it is now, for the last three

weeks. It presents all the usual signs of acute scleritis; great sclerotic vascularity (the "sclerotic zone" well marked), excessive lacrymation, great pain (especially at night, rendering him sleepless) referred to the eyeball, eyebrow, and temple, and compared by the patient to the sensation of "a weight hanging from his forehead, and pulling him down;" eyesight "foggy;" over inner part of the cornea a rust-coloured opaque speck, with a minute depression in its centre, evidenced the accident of five years back, but the most careful examination failed to detect any foreign body in the anterior chamber.

September 24.—R Morph. hydrochlor., gr. $\frac{1}{2}$, every third hour, watching its effects; warm water fomentations to the eye. Took the first dose about four p.m., felt sleepy about six p.m.; second dose about seven p.m.; the pain began then gradually to "die away;" the third dose about eleven p.m.—slept for three or four hours. The following day (Sunday) at noon but trifling pain was felt, and he slept soundly that night.

28th.—The case was reduced to one of slight conjunctivitis; all pain has left him; found his bowels confined from the medicine. To leave off the morphia, and take a purgative dose of calomel and colocynth, which completed the cure.

Case 5.—*Traumatic Acute Scleritis—Morphia Treatment—Decline of the Disease in less than Four-and-twenty Hours.*—C. H., aged 46, was on a Thursday evening engaged in Messrs. M—'s factory, pouring some molten iron into a sand mould, when a quantity of hot sand flew into his eye. He came to the South London Ophthalmic Hospital on Saturday, Oct. 1, 1859. With the exception of two minute particles of sand, which I removed with a spill of blotting-paper, all the sand had been removed by one of his fellow-workmen. I found him suffering from intense scleritis, marked by universal and high vascularity of the sclerotic and conjunctiva, great lacrymation and excessive pain in the eyeball, compared by the patient to the "prodding of a knife," and rendering him quite sleepless.

October 1.—R Morph. hydrochlor., gr. $\frac{1}{2}$, every third hour. Warm-water fomentations.

Took the first dose of morphia about three p.m., and then regularly every three hours. It made him feel very drowsy, and that (Saturday) night he slept soundly. The violent pain was entirely gone on the following morning.

3rd.—The case reduced to one of a simple conjunctivitis, and treated by a purgative dose of calomel, which completed the cure.

Case 6.—*Acute Scleritis—Failure of the Morphia Treatment—Recovery under Depletion and Mercurialisation.*—E. S., aged 48, applied at the South London Ophthalmic Hospital on January 12, 1859. About twelve months before she lost the sight of the now-inflamed eye by a cork from a soda-water bottle. The consequent inflammation of the eye lasted for only a few days; but three or four months afterwards her eyesight began gradually to fade, and she can now only distinguish the outlines (but not the colours) of objects with the injured eye. About three weeks before applying to the Hospital she caught cold in the eye, which now presents the following signs:—Intense sclerotic and conjunctival vascularity ("sclerotic zone" well marked); pupil central of medium size, angular, destitute of contractility. Pain intense, referred to the right eyeball and right side of the head, proceeding from the vertex downwards to the level of the ala nasi.

January 12.—R Morph. hydrochl., gr. $\frac{1}{2}$, every fourth hour. Warm-water fomentations to the eye.

15th.—Pain and other symptoms unabated. She recovered slowly under leeching, blistering, and mercurialisation.

Whether in this case the deeply diseased state of the eye, or the (too) small doses of the morphia, influenced the failure of the drug, must remain a matter of conjecture.

These cases I consider to establish an important practical fact, viz. that morphia is *per se* a powerful antiphlogistic (a) capable of curing these acute inflammations of the eye, in which up to the present time blood-letting, blistering, and mercurialisation have been considered necessary. As regards loss of blood, all will be agreed on the propriety of dispensing with it, where it can be done so with safety. Again how constant an occurrence is it to see paroxysms of acute inflam-

mations for a time apparently relieved by blood-letting, till the subsequent vascular reaction sets in, but to recur again and again, and require as many repetitions of this same objectionable remedy. I would further ask Surgeons and Physicians, What evidence have they that in the combination of mercury and opium given with a view of "putting the patient under the influence of mercury," as it is termed, it is not really the opium which does the good and that the mercury and its action on the mouth may not be, to say the least, useless? (b) And I would finally ask the Physicians of this country to test the powers of morphia in the treatment of the acute inflammations of the internal organs of the body.

If we seek for an explanation of the above very remarkable action of morphia in reducing abnormal fullness of the vessels of the sclerotic, we may find it in the relations of pain to vascular congestion. Pain has generally been regarded rather as the effect, than as the cause of the repletion of blood-vessels; but it is quite an open question, whether or not in certain classes of cases the order of things may not be inverted? Such may be the case in the inflammations of the sclerotic we have just been discussing. That, on the other hand, vascular congestion may react as a cause of pain, is not improbable. The theory I would submit is that the action of morphia in these cases depends on its known power of reducing nervous irritability, which may be viewed as the primary cause of the inflammation. In these deep-seated inflammations of the eye this view is very much borne out by the seat of the pain; this will be found to follow strictly the branches of the fifth nerve; indeed, the precision with which the patients themselves localise the pain is very remarkable, whilst we have further evidence of the nervous nature of these cases in the intense watering of the eye (dependent on irritation of the lachrymal branch of the fifth nerve). In this way I conceive the irritation is propagated to the vessels through the intervention of the connexions existing between the fifth and sympathetic nerves.

Devonshire-street, Portland-place.

THE IRON-WIRE SETON IN HYDROCELE.

By THOMAS DAVIDSON, L.R.C.P., L.R.C.S.E.

THE iron-wire seton having been suggested in the treatment of hydrocele by high authority, and carried into effect by Dr. Young, of Edinburgh, who reported so favourably of its efficacy in the *Medical Times and Gazette*, I felt disposed to give it a trial in an obstinate case which had resisted the usual treatment.

As the result of the treatment was for a length of time doubtful and unsatisfactory, I am induced to lay the case before the Profession.

Case.—R. R., aged 67, the subject of hydrocele of the right testis for ten years, consulted me about three years ago. I at that time drew off by the trocar and canula twenty-two ounces of serum, and afterwards injected half-an-ounce of dilute tincture of iodine into the tunica vaginalis. In about twelve months the fluid reaccumulated, which I evacuated to the extent of thirty-three ounces; but he would not permit me to inject, in consequence, he said, of the pain it occasioned him in the first operation. He was tapped about twelve months subsequently by a Surgeon in a neighbouring town, who, also, was prevented using the iodine injection.

In August last, the hydrocele being of such a magnitude that it prevented the man from following his usual employment, that of a carpenter, I resolved to give him the chance of a permanent cure by employing the wire seton. On the 22nd of August I introduced six threads of the proper wire from below upwards, with a curved needle suitable for the purpose. The fluid, which would measure at the least forty ounces, speedily escaped. I allowed the seton to remain thirty-six hours, when I removed it gently. At this time,

(b) Again, mercury is presumed to have an "absorbing power" over plastic effusions, such as occur in acute iritis: here too it is a fair question whether the absorption of the inflammatory exudations is not rather a natural process, supervening on the cessation of the inflammation (such as we daily see in the absorption of divided cataracts after the operation by solution, as soon as the inflammatory consequences of the operation have passed off) than any, if I may be allowed the expression, "mercurial" process?

(a) In all the cases mentioned, the patients had been using warm fomentations to the eyes before applying at the Hospital.

everything seemed favourable, there being no pain or uneasiness; but in the course of twenty-four hours intense inflammatory action was lighted up in the tunica vaginalis and testis, and distending by effusion the scrotum to an immense extent. It was only by the most assiduous attention, and after using every available means for reducing the inflammation, that its course was ultimately checked. On perceiving fluctuation, I made a free incision into the centre of the tumour, and gave exit to a considerable quantity of fetid pus. In about ten days all discharge ceased and the wound healed; suppuration, however, repeatedly recurred, obliging me from time to time to open the abscesses. The patient was now in the most critical situation, being reduced to a state of great debility, and but for a liberal supply of port wine, beef-tea, etc., the man must have sunk.

The discharge still continuing fetid, I injected into the cavity a solution of chloride of lime morning and evening, keeping the wounds open for many weeks together, and by this means I fortunately succeeded at last in effecting a cure.

By the 10th of November, the wounds were healed, all inflammation had ceased, and the testicle was reduced to its natural size, so that the hydrocele might be pronounced perfectly cured.

The man has not up to the present date regained his strength sufficiently to enable him to resume work, although I expect that in a week or two he will be able to do so. From the extent of the suppuration, and constitutional suffering which occurred in this case, I am apprehensive that without some modification of the operation, the employment of this method of cure will be rather unsafe as a general practice, as we see from the case published in the *Medical Times and Gazette*, for December 10, by Mr. J. B. Thomson, and from another reported by Dr. Gillespie some months ago, that the same constitutional disturbance and excessive suppuration takes place in the young and robust subject, as well as in those more advanced in life.

Belford Villa.

CASE OF HYDROCELE TREATED BY THE METALLIC SETON.

By T. SYMPSON, M.R.C.S.E.

Surgeon to the Lincoln County Hospital.

G. H., aged 4 years, son of a farm labourer, for several weeks attended the Lincoln County Hospital as an out-patient, suffering from a hydrocele the size of a hen's egg. During this time various discutient lotions were applied, and the swelling was twice punctured with a fine trocar without permanent benefit accruing, so on March 14 of the present year he was admitted into the Hospital. On the 15th, by means of a hæmorrhoidal needle, a single silver wire was passed through the sac, and secured by twisting together the two cut extremities. This was allowed to remain in twenty-four hours, by which time the scrotum had become greatly tumefied, and very tender, red, and painful. The constitutional symptoms ran high, and on the 18th, it being plain that suppuration had occurred, an incision was made, which gave exit to about an ounce of pus. After this another abscess formed in the lower part of the scrotum, which required opening on the 25th. Pressure, by means of strapping, was applied on April 10, and on May 16 he was discharged with a scarred and roughened scrotum, but without trace of the hydrocele.

Remarks.—At first I was inclined to ascribe the ill-effects produced by the wire in this case to its having been left in too long; but I now think them more likely to have arisen from some peculiarity of constitution: such results occasionally occurring after other methods of treatment. To all appearance the boy was in excellent health when he entered the Hospital, and there seemed no reason why so simple a procedure as the passing of a silver wire through the tunica vaginalis should occasion so large an amount of irritation; but, probably, had any other operation been substituted, it might have been attended with a similar result.

As the treatment of hydrocele by metallic seton is still *sub judice*, I have thought it right to place this case on record. Lincoln.

THE LONDON PRACTICE OF MEDICINE AND SURGERY.

CLINICAL REPORT ON FAVUS.

(Concluded from page 579.)

DEFINITION AND DESCRIPTION.

FAVUS may be defined as follows:—

A disease of the skin, generally met with on the scalp, characterised by the formation of thick sulphur-yellow crusts resembling dryish putty, which crusts consist almost solely of the thalli and sporules of a fungus.

We are sanguine in the belief that no modification or variety of any disease except Favus ever presents conditions which at all approach to those given in the above short definition.

To describe it we must take considerably more space.

Favus is a disease of the skin of rare occurrence, much more frequent in children than in adults, and seldom or never met with in any excepting the poor. It is characterised by the presence of crusts of a sulphur or canary-yellow colour, which are seldom less, and often more than the sixth of an inch in thickness, which are coherent, but may be made to crumble somewhat like dryish putty, and which are not in the least viscid. These crusts exhale an odour like that of mice, which is often so pungent that a case may be recognised by it alone the moment the patient enters the room. Its crusts when placed under the microscope are seen to consist wholly of cryptogamic elements, sporules and thalli. It is usually met with on the scalp, the interior of the hair-sacs being the favourite habitat of the fungus. It occurs in the most healthy individuals, as well as in the feeble and scrofulous. It almost invariably commences in childhood, and when its subject approaches adult life he usually gets rid of his complaint, though in a few instances the latter may be prolonged to middle age. It never commences *de novo* in adults, except when inoculated. It is communicable by contagion, but does not spread readily, its fungus being difficult of transplantation.

FACTS AND OPINIONS AS TO THE ACCIDENTAL INOCULATION (CONTAGION) OF FAVUS.

FOR.

Mahon states that he purposely inoculated the scalp of a child, which was affected with "chronic eczema," with favus matter, and produced the eruption characteristic of the latter.

Remak succeeded in producing favus by inoculation on his own skin.

Dr. Hughes Bennett succeeded, after much difficulty, in producing a patch of characteristic favus on the arm of a student whom he inoculated. The experiment was only successful when a portion of favus crust was confined by plaster on an abraded surface.

Mahon relates that his brother-in-law contracted characteristic favus on his fingers whilst engaged in making a drawing from a case.

In eleven instances out of thirty cases in our table in which particulars on this point are recorded, the patients considered that they had derived the disease by contagion from others known to have it.

AGAINST.

"Gruby inoculated with the substance of the favus crust, mammiferous animals, birds, reptiles, insects, and himself, but without any success."—*Quoted by Erasmus Wilson.*

Dr. Hughes Bennett failed to produce the disease after several attempts on his own person.

In twenty out of thirty (a) cases recorded in our tabular statement, patients suffering from favus had no reason to suspect that they had contracted the complaint from any one else.

In twenty-four out of twenty-nine cases in our table the patients, although they had been affected by favus for periods varying from a few months to eighteen years, and had in almost all instances freely exposed themselves to the risk of communicating it, had in no instance any reason to believe that others had caught it from them.

In not a few of the cases referred to in the above general

(a) We cannot employ the whole series of forty-four cases, because in a certain number the details required as to this point are not recorded. This omission does not, however, in any way vitiate the statement of statistical proportions.

For.

The subject of Case 3 was under Dr. Risdon Bennett's care in St. Thomas's for favus, and in the same ward was John N., the subject of Case 19. The boys were very intimate, and often played together. One day John N. presented a characteristic patch of favus on his shoulder.

Mary S., the subject of Case 5, stated that she had communicated the disease to her sister.

William C. and Elizabeth C. (Cases 14 and 15) were brother and sister, and the latter was believed to have contracted favus from the former; both had the disease in a severe form.

Margaret C., the subject of Case 38, contracted favus while an inmate of the Edinburgh Infirmary, under the care of Dr. Hughes Bennett, in the same ward, as Isabella F., who was under treatment for that disease.

Bielt writes, "Favus is evidently contagious, although in some instances the attempt to produce contagion has entirely failed."

Cazenave considers it "essentially contagious."

Gibert writes, "The contagiousness of favus is an established fact."

Mr. Erichsen avers, that "there cannot be the least doubt that it is very frequently and very readily communicated by contact."

Rayer states that "favus is a contagious disease."

Dr. Jenner (1853) considers that the fact "that tinea favosa (favus) is contagious was placed beyond doubt by Remak." (For Remak's experiment see above.)

Dr. Neligan writes, "It is a contagious disease, the vegetable being propagated by the mycelia."

We have entered at so much length into the statement of facts bearing upon the question of contagion, not because we consider that the question itself admits of any reasonable doubt, but in the hope of affording some estimate of the degree in which favus possesses this property. When three different and trustworthy experimenters (Mahon, Remak, and Bennett) tell us that they have succeeded in conveying the disease in a typical form by artificial inoculation, the possibility of its communication must surely be regarded as established. All that is requisite for its contagion, in the popular sense of that word, is, that the conditions under which these observers succeeded should occur by accident. Indeed, to admit the cryptogamic nature of the disease, which few now-a-days will be disposed to doubt, is to admit its contagious properties, since, without equivocal generation, the germs of the fungus must be obtained somewhere, and are likely to be easiest had from some one who possesses them. Regarding, however, the fact that favus can be communicated by contagion as an established fact, there still remains the important practical question as to whether it frequently is so—whether, indeed, it is contagious in such a sense that the subjects of it ought to be kept apart from others. In replying to this we must take into account the loathsome and inveterate nature of the disease itself. Although the probability of its

Against.

statements the risks of contagion had been unusually great; thus the patients had in several cases slept with other children, had used the same brushes and combs, occupied the same ward in Hospitals, workhouses, etc.

In Case 33 of the tabular series the patient is a woman who has been affected with favus of the scalp for eighteen years, and who still has large patches of crust. During the period she has married and nursed five children, but neither her husband nor any of her infants have ever caught the disease.

Alibert had doubts as to the contagious properties of favus.

Dr. Corrigan writes, "I believe it is not contagious."

Mr. E. Wilson states, "My own careful investigations have forced on my mind the conclusion that favus is not contagious."

spreading be but small, yet it would surely be imprudent in any Medical man to countenance the reckless exposure of healthy children to the risk of contracting such a disgusting malady.

THE CAUSE AND MODE OF COMMUNICATION OF FAVUS.

Two schools of opinion exist with regard to the diseases of skin, which are attended by the development of parasitic fungi. The one asserts that these fungi are the sole causes of the eruptions which they attend, and the other that they are little more than an accidental growth upon a pabulum provided for them by a previously-existing morbid condition. With regard to Favus a large majority of authors have adopted the latter view; and having regard to its inveteracy, and its occurrence among the poor only, have taken for granted that it must be associated with a predisposing constitutional condition. Let us examine how far the evidence we have adduced in the present report supports one or the other view.

The following facts have been conclusively established:—1. That it is communicable by inoculation, and sometimes spreads by contagion. 2. That it is of very infrequent occurrence, but is scattered pretty evenly over the British population, and probably with nearly the same degree of frequency over that of the Continent. 3. That it prevails among the poor only. 4. That it is not, excepting in a few instances, met with in association with marked debility, or tendency to scrofula. Now, when a disease, known to be contagious, is met with very rarely, and at the same time occurs in scattered instances widely spread over large communities, two inferences are suggested,—1. That the sources of its contagion must exist very widely; and 2. That the conditions under which contagion can be effected must be very peculiar and unusual. With regard to the second of these we have shown that no evidence whatever exists in favour of the belief that peculiarity in the state of the recipient's health constitutes the element which favours contagion, and we must therefore seek it in the plant itself. That the favus plant needs no previously-existing morbid pabulum for its growth is placed beyond a doubt by the fact that it will develop luxuriantly when introduced intentionally into the skin of a healthy person. The only conclusion left open to us is, therefore, that favus does not become a common disease because its fungus is difficult of transplantation. Granted the possibility of its transplantation, and at the same time its difficulty, and all the facts of the disease are explained, excepting that of wide dissemination. To account for the latter, as first said, we must suppose its seeds to be very generally prevalent. It is extremely improbable that the human subject is the only source from whence its germs are obtained. The lower animals (and mice in particular, since the favus fungus has been proved to infest them) (b) are probably in many instances its communicators. Accepting this hypothesis, it is easy to see why the poor are almost its only subjects: since careless and dirty habits must manifestly favour its communication, and ordinary cleanliness render its spread almost impossible.

A careful review of all the facts of the case induces us therefore, to hold that favus on the human scalp is just as truly and simply a parasite as mistletoe is on the apple-tree, that the implantation of the one as of the other is a matter of accident, and that the rarity of both is accounted for by the difficulty with which such implantation is accomplished. Mistletoe will grow on the healthiest apple-trees, and prefers those which are moderately young. The fact that the favus crust is not viscid, but dry and powdery, and at the same time heavy, will go far to explain its infrequent transplantation, since it can neither be blown about in the air, nor does it adhere easily where it may chance to fall.

CIRCUMSTANCES WHICH FACILITATE THE SPREADING OF FAVUS.

The communication of Favus must be regarded simply as a process of transplantation of a cryptogam. It is difficult under ordinary circumstances; its elements are not viscid, and have little power of fixing themselves in the cutaneous surface. Whatever favours the access of its spores to the hair follicles assists its contagion; and we may here remark that if in any peculiar temperaments or states of health the follicles are

(b) It is not improbable that mice owe part of their disagreeable odour to their liability to favus. Some mice smell much more pungently than others. The odour of a favus scalp is exactly that of mice concentrated.

more open than usual, such conditions may be readily admitted to be likely to favour its spreading. Accidental inoculation, whether by the finger-nails or by the teeth of a comb, probably occurs not unfrequently, the surface being abraded, and the fungus thus implanted.

The very curious circumstance has been noticed by several observers (Hebra (c), Jenner, etc.) that true ringworm of the scalp (*tinea tonsdens*) favours the aggression of favus. Dr. Jenner states that he had a favus patient in one of his wards at the Children's Hospital for some weeks, without any instance of contagion occurring, until at length several cases of *tinea tonsdens* were admitted, when the latter at once became affected by favus also. That the one does really prepare the way for the other, is rendered additionally probable by the observation that the favus spots always showed themselves on the patches of ringworm. It has been alleged in explanation of this phenomenon, that the one vegetable growth probably prepares the soil for the other, just as a crop of oats is considered to prepare for a crop of clover. We doubt much, however, whether a simpler explanation is not amply sufficient, and whether to consider the *tinea tonsdens* in the light merely of a plough (to still borrow agricultural similes) would not be more correct. The latter destroys and breaks up the hair, thus exposing the scalp surface; and it also disturbs the epidermis, and thus renders the access of the favus sporules and their adhesion to the part more easy. Thistledown, which would not easily plant itself in a luxuriant meadow, will grow with ease if the sods be once disturbed by the plough or spade.

Other scalp diseases common in childhood, such as the common porrigo, impetigo, eczema, etc., do not appear to render their subjects liable to favus. The reason of this is obvious,—instead of exposing a clean scalp surface with its epidermic scales partially detached as *tinea* does, these affections coat the skin over with a more or less thick and protective scab. A clear proof is here that the favus fungus is not, as some have fancied, merely a growth of mould on the accumulated secretions of other eruptions.

DOES FAVUS EXERT AN INJURIOUS INFLUENCE ON THE GENERAL HEALTH?

In several of the cases in our series, the patients were stated to have had good health prior to the outbreak of the disease, and to have been ailing ever since. (See Cases 14, 15, and 16.) In several, also, in which the patients were girls, menstruation had been unusually delayed. Observers have adverted to the supposed fact, that its subjects are usually of dull intelligence; but this is surely explicable by the circumstance, that they are prevented by the loathsome nature of their disease from going to school, and to a large extent from free and equal association with other children. It may easily be granted as probable, that a disease which must almost wholly suspend the function of the tract of skin which it affects, and which often involves a large extent of surface, cannot possibly be without some deleterious influence on the general health. The measure of the prejudicial effect is probably in proportion with the extent of surface affected. In rare instances it may almost cover the body, and in such very serious consequences may be expected to ensue. There is in the Museum of St. Thomas's Hospital, a portion of favus skin preserved, said to have been removed from the body of a young man who had died of the disease. Several authors mention the occasional occurrence of death from favus, but we have not met with any recorded example of it. Our series abundantly proves that in a large majority of favus cases the general health of the patient is not materially interfered with.

DIFFERENTIAL DIAGNOSIS.

Eczema, Porrigo, and Impetigo are the only eruptive diseases with which Favus can possibly be confounded, and the circumstances are very infrequent in which there can be any difficulty in the diagnosis.

From *Eczema* Favus may always be distinguished—1st, By its mouse-like odour; 2nd, By its thick powdery crust, consisting of sporules instead of epidermal and inflammatory elements. It is only when, on the one hand, the eczematous crust is very thick, and, on the other, that of Favus is supposed to have ill-marked characters, that any chance of confusion can occur.

(c) In several of Hebra's magnificent plates this conjunction of the two diseases is shown.

Common Porrigo is the disease which is constantly confounded with true favus. Its crusts are, however, moist and viscid, instead of dry and powdery, and under the microscope they show pus and exudation cells, instead of sporules and thalli. Its odour is often very disagreeable, and almost fetid, but never pungent and mouse-like. It does not destroy or thin the hair, but mats it together. The duration of the case may often be used as a guide in diagnosis; a favus patient will usually tell you that he has had his eruption for many months, if not years, while the history of porriginous cases is usually one of a few weeks.

Impetigo very rarely simulates the characters of favus. When it does so, it approaches those of porrigo, and the above remarks will apply equally well to it.

TREATMENT.

The fact stated of the obstinacy of cases in our series, despite the most various plans of treatment, sufficiently indicates the intractability of favus. Almost all writers who have boasted of their ability to cure favus have committed one of two mistakes; either they have taken cases of porrigo for those of its far more severe and inveterate congener, or they have considered their patients "cured" as soon as the eruption ceased to appear. The majority of its vaunted remedies have, therefore, no claim to our notice. The following plans of treatment are those of different modern dermatologists well acquainted with the diagnosis and true pathology of the disease:—

Mr. Startin's plan of treatment, as adopted at the Hospital for Diseases of the Skin, is to clean away the scabs, either by poultices or careful washing, and then apply freely an ointment containing sulphur and the ammonio-chloride of mercury. The latter should be in proportion of about a scruple to the ounce of lard. By this plan we have often seen scalps which have been covered with favus got perfectly clean, and apparently cured in the course of a few weeks.

Dr. Jenner's treatment is, like Mr. Startin's, based on the principle of employing parasitocidal remedies, and consists in the free use of lotions or baths containing sulphurous acid.

Dr. Hughes Bennett endeavours to prevent vegetable growth by the exclusion of atmospheric air, applying with that object cod-liver oil, and covering the scalp with oil-silk.

Dr. Neligan employs an ointment of the iodide of lead, after having cleaned the scalp by poultices and alkaline washes (d).

We cannot think that it is a matter of any very great consequence in what manner the cryptogam-destroyer is used, or whether the drug chosen be creosote, mercury, or sulphur. Whatever plan is adopted, the secret lies in following it out perseveringly, and without suspending it, because the disease may appear for a time to be well. The removal of the hairs from the affected part by means of tweezers, is a measure which, if the patient will allow it, and the Surgeon has zeal enough to adopt it, is one likely to materially increase the chance of genuine cures being obtained.

Attempts have been made to calculate the average length of time required under different methods for the cure of this inveterate disease. Thus Dr. Hughes Bennett states that he found the average duration of his plan to be six weeks. But in truth, no case of favus ought to be counted as "cured" unless it has been watched for a full year. That after a month or two of medication in an Hospital, a favus scalp is got quite free from crust, and that it remains so for a few weeks, is a kind of fact which must go for nothing. If such cases are "cures," we might count most of the cases in our series many times over, since they had been discharged well for the time being from many Hospitals. Our own position, as attending the practice of many Hospitals, afforded us peculiar advantages for becoming acquainted with the inveterate character of favus, and its extreme liability to relapse. Over and over again we met a patient whose case we had observed with interest in one Hospital, and who had been at length dismissed as "cured," under treatment at some other Institution a few months later.

(d) It should be stated that Dr. Neligan, Dr. Hughes Bennett, and Mr. Startin, all employ constitutional treatment, and insist upon it as of importance. This, however, is, according to our own deductions, wholly needless, excepting in special cases where the patient may chance to be out of health. If relied upon as of efficiency in the cure, it may become worse than needless, leading to neglect of topical remedies.

SUMMARY OF CONCLUSIONS.

1. That favus is a disease wholly depending upon the implantation of a fungus.
2. That it is contagious, and, in fact, spreads solely by contagion; but that its fungus being difficult of transplantation, it is but rarely communicated.
3. That the conditions which favour its communication are neglect of personal cleanliness, the existence of tinea tonsurans, and any irritation such as the rough use of a comb, etc. which approaches to the performance of inoculation.
4. That the young only are liable to its outbreak, but that it may be produced by intentional inoculation in adults.
5. That the fungus develops chiefly in the hair-follicles.
6. That its crusts consist almost solely of fungus elements, and that it is thus easily diagnosed by the microscope.
7. That the state of the patient's general health has little or nothing to do with favouring its outbreak.
8. That it has no connexion whatever with struma.
9. That it usually attacks children between the ages of one and twelve, and that when once well established in the scalp is rarely got rid of before adult age.
10. That if it continues long unarrested it destroys the hairs and their follicles.
11. That it is a disease never seen among the better (*i. e.* more cleanly) classes.
12. That it is of infrequent occurrence, and that it appears to occur with almost equal rarity in proportion to population in London, Edinburgh, Dublin, and Paris.
13. That when it occurs on the naked integument it is easily curable, but when on the scalp it is most intractable; the difference probably being that in the latter position its spores spread deeply into the long hair-follicles, where they escape the influence of parasiticial remedies.
14. That the only available treatment is by the persevering employment of one or other of the parasiticial drugs, sulphur, creosote, or mercury, the action of which is greatly facilitated by epilation of the part.

JONATHAN HUTCHINSON.

SIR RALPH ANSTRUTHER has been appointed Rector of the University of St. Andrews.

MANCHESTER ROYAL SCHOOL OF MEDICINE AND SURGERY.—The annual distribution of prizes and certificates to students in the above school took place on December 14, in the Lecture Theatre of the Royal Institution. Prizes for Third Year's Students: Scholarship, value £20.—No award. First Prize, value £5 5s.—Mr. Joseph Bancroft, Stretford; Second Prize, value £3 3s.—Mr. William Stanfield, Dukinfield; Third Prize, value £2 2s.—Mr. William L. Powell, Macclesfield. Prizes for Second Year's Students: Scholarship, value £15.—Mr. John Cockroft, Middleham, Yorkshire. First Prize, value £5 5s.—Mr. William H. Barlow, Manchester; Second Prize, value £3 3s.—Mr. Daniel J. Leech, Hulme. Prizes for First Year's Students: Scholarship, value £10.—Mr. Herbert Grove Lee, Thame, Oxfordshire. First Prize, value £5 5s.—Mr. George Huntstone, Broughton; Second Prize, value £3 3s.—Mr. James Allen, Macclesfield; Third Prize, value £2 2s.—Mr. Bath. C. Smart, Greenheys; Fourth Prize, value £1 1s.—Mr. A. F. Pennington, Warrington. Certificates of Merit for First Year's Students: Mr. Frederick J. Roberts, Hulme; Mr. Arthur Kidd, Chorlton-upon-Medlock; Mr. Robert Paton, Manchester. Prize for Animal Physiology.—Mr. James Yates, Oldham. Certificates of Honour: Messrs. William N. Hughes, Robert Paton, John Gregory, George Huntstone, John Holt, William Hoyle, T. P. Dean, Frederick Fairbank, F. Worthington, Daniel Taylor, Daniel Leach, Henry Cartmel, F. Roberts, F. A. Pennington, Thomas Hill, James Yates, James Allen, John Wells, Arthur Kidd, William Walls, James M. Rigby, George Howarth, W. H. Rayner, W. O. Jones, W. R. Powell, J. Bancroft, Octavius Dean, David Brown, W. H. Emmett, Hiram Utley, W. H. Barlow, J. G. Nicholson, William Hoyle, Robert Jones, W. J. Hunt, John Guest, Frederick Folkes, Thomas Martin, J. R. Bramwell, James Howson, Thomas Tweedale, William Bird, William Folkes, John Willett, Bath. C. Smart, George Clapperton, John Anderton, George Newton, John Cockroft, Thomas T. Ker, E. R. Lever, Abraham Leach, J. W. Morris, H. C. Boutflower, John Watson, Samuel Rains, Dennis Meany, Herbert Lee, J. Hollinworth.

Medical Times and Gazette.

SATURDAY, DECEMBER 31.

1859.

THE publication of this number of our Journal brings us to the close of the year 1859. It began more hopefully for the Medical Profession than many that have gone before. A new order of things was being gradually set in operation; we had promise of enjoying the fruits of the leisure and clear-mindedness of a few years of peace, and a fair field for exertion in carrying out the duties of our calling lay before us all. We do not think that a brief review of the events that have happened, and of the work that has been accomplished, will do other than cheer us on to future efforts, and bring to light as little ground for regret as can be expected in the ordinary course of human affairs.

The new year opened upon us in all the bustle of registration, each one endeavouring to settle himself into his appointed place in the Professional ranks, and to prevent the intrusion of pretenders. Soon upon this, and as it were spontaneously, arose the general out-growth of Registration Societies; which, originally intended to aid the registrar in the production of a correct list of qualified persons, have since developed themselves into the more useful shape of district boards of guardians, watching the proceedings of impostors, and following out their practices to conviction and fine before the local tribunals. These societies now embrace the greater part of the kingdom, and many of them have become affiliated with the Central Association in London. It was not long before the new Act was proved to be no dead letter. The first case of prosecution to which it gave rise was that of Messrs. Prothero and Reeves, for conspiracy to defraud the Dublin College of Physicians; resulting in a plea of guilty. Many other charges of practising without qualification have since been substantiated, owing to the intelligent determination of the greater part of the magistracy to act in accordance with the intentions of the Legislature. The case of Henry Scott, however, as decided by Mr. Jardine, led to the discovery that no Register, properly so called, was in existence, and to the passing of an order by the Medical Council for a manuscript register to be prepared forthwith. This body, as constituted in the previous autumn, with Sir Benjamin Brodie, President, resumed its sittings in the month of August. Having already disposed of its formative arrangements, and provided for the publication of the Register, which took place early in July, it now proceeded to the more important business connected with the question of education and examination; confining attention, however, this year solely to one point, that of Preliminary Education. Full minutes of these meetings will be found in their proper place in this Journal.

The first gathering of the new Obstetrical Society of London came off at the beginning of January, and was chiefly devote

to an Inaugural Address by the President, Dr. Rigby. Its success has now been assured by the industry of its officers, and the steady increase in the number of its members. In connection with this subject we may note that Sir James Clark was in this month summoned to Berlin to be present at the accouchement of the Princess Frederick William; and about the same time the Profession was gratified by the appointment of Dr. Watson, as Physician Extraordinary to the Queen.

One of the first events of the year was the issuing of a memorandum by the President of the Poor-Law Board, suggesting modifications in the manner of furnishing Medical relief, by which he sought to ascertain the feelings of the Guardians and Surgeons as to some important changes of the present system. We are not aware that any good has hitherto arisen from the agitation this document occasioned, but we feel confident that it only requires full and temperate discussion to bring these matters to an equitable adjustment. The publication of this paper of proposals was speedily followed by that of the temporary bye-laws of the College of Physicians of London, regulating the admission of its Extra-Licentiates and Diplomated Physicians as Licentiates, and of its Licentiates to the Fellowship. The influx of new members commenced in April, but was for a time restrained by the anticipation of a remission of the stamp duty. This has since been granted, and the College is now gradually drawing into adhesion all those who take rank throughout the country as Consulting Practitioners. By a regulation just announced the title of Member has been substituted for that of Licentiate. The election of Fellows is not yet carried out to its full extent.

The discovery of the remains of John Hunter, in the vaults of the church of St. Martin's-in-the-Fields, by Mr. Frank Buckland, of the Life Guards, their public removal to Westminster Abbey, and the subsequent resolution to erect a statue of that great man, occurred in the spring; and roused the College of Physicians to inquire into the condition of the tomb of its most illustrious member, Harvey. A deputation visiting Hempstead found it in a disgracefully neglected state. It was not, however, thought advisable to move the body, but measures were taken to secure its decent conservation for the future.

In reference to the Army and Navy we may recall to the minds of our readers the promulgation by Lord Stanley, in May, of the Indian Army Medical Warrant, the most commendable points in which are the promotion of officers by merit, the compulsory retirement of those who are superannuated, and the complimentary designation of some of the most meritorious as Honorary Physicians and Surgeons to the Queen. In this month also came out the Warrant regulating the rank and pay of the Medical Service of the Navy, placing the officers upon a footing of equality with those of the Army. For this act of justice they are mainly indebted to Sir John Pakington, then First Lord of the Admiralty. The nomination of Honorary Physicians and Surgeons has since been gazetted. Nor should we overlook the boon to our brethren in the two services of the partial abolition of the practice of flogging the men; nor the gracious recognition of the noble deeds of some of them, by the presentation of the Victoria Cross to Staff-Surgeon Home and Assistant-Surgeon Bradshaw, of the 90th and 32nd Regiments, of Lucknow fame; nor the well-earned and hearty thanks of Admiral Hope to his Medical officers engaged in the Chinese expedition; all indications of a better estimation for the future of those who have till now been unfairly neglected.

The trials of Smethurst and a journeyman shoemaker on the charge of poisoning their reputed wives, took up a great share of public attention during the autumn. The case of Smethurst is a complete anomaly. He was condemned by a common jury; had the whole evidence upon which he was

convicted by the common sense of his fellows re-opened, and, with much more, laid before the Home Secretary for judgment, without enabling that functionary to arrive at any conclusion; and finally found his fate left to the sole decision of Sir Benjamin Brodie. This appeal, which must be regarded as a compliment to our Profession, outweighing all the aspersions which have been thrown upon the value of Medical evidence, procured for the prisoner a pardon, not an acquittal. The study of the whole matter furnishes many useful lessons, and should stir up every one to a careful consideration of what is due, and rightly expected, from him in his position as Medical witness in criminal charges. The other case of poisoning opened up some curious toxicological questions, which have yet to be investigated. The decision in the Court of Queen's Bench established Dr. Storrar in his office; and declared the Senate of the University of London to be the proper body to elect a Member of the General Council of Medical Education, in pursuance of the 21 and 22 Vict. c. 90.

The legislation of the year bearing upon Medicine has not been important; and was chiefly directed to the amendment of Acts already in force. The Public Health Bill, the Medical Acts Amendment Bill, and the Scotch Universities Bill, only require notice. The new rules proceeding within the last few weeks from the Privy Council respecting Vaccination, are full of minute detail, but leave untouched the questions of remuneration and of vaccination in the colonies. Some recent occurrences also show the necessity of determining what provision ought to be made for the lunatics discharged from the public services.

Our Medical Schools opened at the usual time, well, in point of numbers; admirably, so far as we had opportunity of observing, in respect to the character and fundamental acquirements of the students. But, above all other things, it is worth noting the honest, manly, conscientious tone of the addresses which are now delivered on these occasions. Very little do we hear of jest or ill-timed humour. Man speaks to man in earnest. Work is sketched out, duties are enforced, and the true motives that should actuate us all are avowed with a total freedom from sentimentality, and with a plainness that bespeaks sincerity on the part of the teachers, and a well-founded confidence that they are appealing to minds and hearts already trained to a proper estimate of their responsibilities, and a determination to act up to them. The work of education undertaken in such a spirit must prosper. Among the principal novelties of the year are the inauguration of the Metropolitan School of Dental Science, and the organisation of the Practical Army Medical School. This latter Institution has a distinct and independent existence under the War Secretary, and is governed by its own Senate, consisting of its five Professors and the Director-General. The subjects of its special teaching are Hygiene, Clinical and Military Medicine and Surgery, Pathology and Chemistry; and all the instruction will be directed to the necessities of the Military Medical Service. Within the last month, the College of Surgeons have advertised their regulations relating to the preliminary examination of candidates for the diploma of Member, which will affect all persons who shall commence their Professional education on or after the 1st of January, 1861.

Such is a Summary, upon the whole gratifying, of the leading events of the year 1859 as affecting the economy and social relations of the Profession. The scientific proceedings and discussions must be more briefly enumerated. Sir Benjamin Brodie's first *Soirée*, as President of the Royal Society, was as brilliant a testimony to his philosophical reputation as could be desired. The presence of the Prince Consort, and an unusual assembly of eminent men, did honour both to him personally and to the Profession that he represents. At no former meeting of the British Association for the Advancement of Science have the Medical Sections been so well or ably supported as that held at Aberdeen in September. The

papers read were numerous and important, and the work undertaken promises to be of great utility. The meetings of the Association for the Promotion of Social Science at Bradford, also demonstrated no small degree of zeal and activity on the part of its Medical members. We must, however, confess that such displays are not much to our taste; though they may, perhaps, answer the purpose of stimulating a sluggish public curiosity and airing a little bustling vanity. If Sociology be a science, we do not see that its votaries require a Rotten-row for the social discharge of their energies. We have much more faith in individual effort and work done at home. The Medical aspect of the Ulster Revival, the state of the River Thames, the Influence of the Builders' Strike on the Mortality of the families of the men joining in it, the Award of the Swiney Prize to Dr. Taylor for his Work on Medical Jurisprudence, the retirement of Mr. Busk, and the succession of Mr. Savory, as Hunterian Professor at the College of Surgeons, and the Introduction of the Flesh of the Eland as an Article of Food, have all been matters of attention. Our columns have also more or less largely illustrated the questions of the Nature and Cause of Diphtheria, the Treatment of Aneurism by Position and Pressure, Ovariectomy, the Radical Cure of Hernia, the Castration of Epileptics, Tubular Drainage, the Result of the Fell Treatment of Cancer, the Chronometry of Life, and many other Medical problems. The publication of Dr. Simpson's Lectures, of our Hospital Reports and Statistics, of our Parliamentary Intelligence, of our accounts of the proceedings of the various Societies, and of the particulars of the Competitive Examinations at the Universities and the Indian Army Board, has gratified and instructed many of our subscribers. We can also refer with satisfaction to numerous leading articles, in which such important subjects as the following have been brought under notice:—The Health of the Army and Navy, the Prevalence of Venereal Disease in the Army, Flogging in the Army and Navy, the Pay and Usage of the Officers in the Queen's Indian Medical Service, Soldier Lunatics, Rifle Corps and their Medical Members, the Impolicy of Gratuitous Medical Services, Objection to Sanitary Trifling, Liebig's Views on Agriculture and Sewage, the Imperfections of the present System of Vaccination, the Duties of Medical Attendants in Cases of Suspected Poisoning, Advertising Quacks, Suburban and City Hospitals, Defects in Registration, the Controversy about the Edinburgh College of Physicians, the forthcoming Pharmacopoeia, the New Fellows of the College of Physicians of London, and the Proceedings of the College of Surgeons. Even this partial enumeration of some of the topics we have discussed may be useful in refreshing the memory, and at any rate will show that we have not overlooked much that has happened of general interest.

The literature of the Profession has this year been copiously enriched. New books and new editions have been published incessantly. It is worth while recording the titles of some of the more valuable or remarkable. We may mention Richardson's "Life of Snow" and Snow "On Chloroform," West's "Diseases of Women," Skey's "Surgery," Hassall "On Urine," Nunn "On the Arteries," Gray's "Anatomy," Brown's "Horæ Subsecivæ," Ogilvie's "Master Builder's Plan," Bennett's "Physiology," Brinton "On Diseases of the Stomach," Maunder's Translation of "Ricord on Chancre," White Cooper "On Wounds and Injuries of the Eye," Tomes "On Dental Surgery," Bucknill's "Psychology of Shakspeare," Wilks's "Lectures on Pathological Anatomy," Bryant "On Diseases of the Joints," Fraser "On Penetrating Wounds of the Chest," Althaus "On Medical Electricity," and "Guy's Hospital Reports." The New Sydenham Society has also more than kept faith with its supporters; and the completion of Todd's "Cyclopædia of Anatomy and Physiology" calls for special record.

Neither has the hand of Death been stayed among us.

With regret, but submission, we have registered a long list of the dead. Honour is due to such names as those of Dr. Lever, Dr. Cotton, Dr. John Scott, Mr. Squibb, Mr. Alexander, Jacob Bell, Dr. Allen of Portsmouth, Dr. Pring, Mr. Guthrie, Dr. Alison of Edinburgh, Dr. Barker of Dublin, Dr. Carnegie, Dr. Roots of Kingston, Professors Lawrie and George Wilson, and last, not least, Dr. Montgomery. Having before us their example, respecting their virtues, aspiring to fill the void they and others have left with equal benefit to our fellow-creatures, and assured that they have gone to their rest and their reward, let us all look forward humbly, but with courage, to the dawn of a new year, and the labours it will bring with it to us, as God's ministers of life and health upon earth.

THE WEEK.

We have on a former occasion alluded to the harsh treatment which Dr. Wall, of the Dunmanway Union, has experienced at the hands of the Irish Poor-Law Commissioners, who dismissed that gentleman, under sealed order, from his appointment of Medical Officer, upon grounds which are wholly insufficient to justify so severe a measure. The proceedings which have subsequently taken place are in the highest degree creditable to Dr. Wall and to the whole Medical Profession in Ireland. On Thursday, December 15, a numerous and highly-influential meeting of gentlemen belonging to the Medical Profession in Ireland was held at the Limerick Junction Hotel, for the purpose of considering the circumstances connected with Dr. Wall's case, and of preparing a petition to Parliament against the arbitrary conduct of the Irish Poor-Law Commissioners. It will be found that the hardship inflicted upon Dr. Wall is the greater, in proportion as the particulars are better known. It appears that a man, driving furiously when in a state of intoxication, received a comminuted fracture of his leg, and was eventually removed to the Dunmanway Union Hospital, of which Dr. Wall is the Medical officer. Dr. Wall announced to the patient and his friends that the only chance for saving life, was by amputation, but this proposition was met by a positive refusal from all parties. At the urgent request of the friends, the Chairman of the Board of Guardians of the Dunmanway Union consented to give an order for the admission of the patient into the Cork Infirmary, and, in the temporary absence of this gentleman, Dr. Wall signed the order. The document, however, for some reason, was not acted upon, and the patient was not removed, but he eventually died from the effect of the injuries he had received. No imputation of neglect was made against any one on the ground of improper Medical treatment; and, as far as we can understand, the only offence committed by Dr. Wall was his giving a provisional order for the man's removal, this step being taken at the request of the man himself and his friends. An inquest was held upon the body, but the evidence was so imperfect that the Grand Jury actually withheld the fees from the Coroner who made the inquiry. The Poor-Law Commissioners, however, called upon Dr. Wall to resign, and, upon his declining to do so, they dismissed him; and the office being thus vacant, a new election took place. To the infinite honour of the Medical Profession in Ireland, no Medical gentleman applied for the vacant post except Dr. Wall himself, who was consequently re-elected. The Board of Guardians being thus perfectly satisfied with Dr. Wall, and having re-elected him, it might be thought that the matter would drop; but the Irish Commissioners appear to have been actuated by some vindictive feeling, and, after a series of harassing annoyances, they at last dismissed Dr. Wall from office by sealed order, thus preventing him from holding any other appointment under the Poor-Law. Against this most harsh and cruel proceeding, the Profession

at once protested, and begged for a re-hearing of the case from the Irish Commissioners; but, as we represented on a former occasion, the remonstrances were met by an insulting and contemptuous refusal to re-open the question. It has now, therefore, been determined to petition the Imperial Parliament on the subject, and we cannot but hope and expect that the voice of the Irish Medical Profession, so loudly and unanimously expressed, will meet with an attentive response on the part of the Legislature.

Our readers will find in other columns an able letter from Mr. Steele, of Liverpool, and a report of a case of very considerable importance. Mr. John Hamilton, of Liverpool, was summoned before Mr. Mansfield, a stipendiary magistrate, for an alleged offence against the Medical Act, in practising as a Surgeon without being registered. It was proved that the defendant represented himself as a Surgeon of Boston College, that he attended a patient, and furnished Medicines for which he was paid; and his patient having died, that he gave a certificate of death, signed "J. Hamilton, Surgeon." A business-card issued by the defendant was also put in as evidence, in which he described himself as "Member of the Reform College of Surgeons, Boston, United States, Practitioner of Medical Botanic Dispensary," etc. Mr. Mansfield did not think that the statements put forth made it appear that the defendant was registered under the Act, as he was charged with representing himself, and, therefore, dismissed the summons. The case will, however, be referred to a higher Court to settle the question, which is one of much importance to the Profession, especially in reference to foreign degrees. Unless stopped by some authoritative legal decision, there is likely to ensue an inundation of such degrees, greatly to the detriment of qualified Practitioners, who will be undersold by all descriptions of nondescript Reform Colleges, and Backwood Universities.

A correspondent has forwarded us the following statement to show that the Admiralty offer all the opposition in their power to the effectual compliance with the Royal Warrant of the 13th of May last:—

"That Warrant runs thus: 'An Assistant-Surgeon after six years' service on full pay shall rank as a Captain in the Army;' also, 'a Surgeon shall rank as Major in the army;' and then it goes on to say, 'such relative rank shall carry with it all precedence and advantages attaching to the rank with which it corresponds, and shall regulate the choice of quarters.'

"Such is the promise—now for the performance. An Assistant-Surgeon, serving on shore, having completed six years' time, applies for Captain's quarters. Application refused.

"A Surgeon of a ship is sent sick to hospital, the Medical officer of which, guided by the Warrant, gives him the quarters assigned to field officers—i. e., officers holding the rank of major; the Captain in charge of the hospital is of opinion that the Surgeon is not entitled to these quarters, and refers the matter to our friends, the Board of Admiralty, who reply that a Surgeon is only entitled to the same quarters as the Lieutenant and Engineer of the ship.

"With regard to the precedence and advantages granted, *voilà!* Several Surgeons have been well snubbed for respectfully requesting that this clause should be acted up to; in one case the octogenarian Admiral tears up the Surgeon's letter, saying that the Admiralty had quite enough to do without troubling themselves about such matters; in another, the Surgeon is severely reprimanded, and threatened with a court-martial; the upshot of all this being, that except in the matter of pay, Surgeons are precisely in the same position as they have been in all along.

"The Army Medical officers have had a change made in their uniform since the issuing of their Warrant, but none has been, or seems likely to be made in that of their Naval brethren. One of the Lords of the Admiralty was not long

since in the shop of one of our Naval outfitters, who asked him if any change was going to be made, and the courteous reply of the Admiral was, 'I'm ——— if they shall have it if I can prevent it.'

"The last mail from Australia gives an instance of the *animus* which some, though I believe few, Captains still entertain towards Medical officers. The Surgeon of a brig died at Sydney; the brig was to have gone to sea the following day. The Captain of the brig asked permission of a senior officer commanding another ship to remain until the funeral had taken place. The other Captain refused, saying, 'Oh, never mind him; we can get a hearse for him after you are gone.' The Military officers of the garrison then came forward and superintended the funeral, though there was a man-of-war in the harbour at the time."

Our readers who possess the interesting account given by our Paris correspondent of the doings of Dr. Mangeant, published in our number of December 17th, will be rather amused at the following letter published in the *Times* this week:—

"TO THE EDITOR OF THE TIMES.

"Sir,—A medical friend, residing in London having seen a letter in your paper on the above subject, requested me to call on Dr. Mangeant, No. 8, Faubourg St. Denis, to procure some of the virus for his professional use. Having called, I found Dr. Mangeant confined to his room, and at present quite incapable of moving from it. He showed me about fifty letters received from all parts of the United Kingdom, to all of which he is at present unable to reply, and his Medical adviser holds out no prospect of his being able to do so before the middle of next month, at the earliest. As soon as he can he promised me to attend to all those not already answered.

"With very few exceptions these letters are written in English, with which the Doctor is not acquainted; I would therefore suggest that all persons writing him should do so in French—never mind however bad.

"The price of the tube is five francs in Paris; if sent by post, the packing costs half-a-franc extra; and there is enough virus in each tube to inoculate three or four persons.

"I promised Dr. Mangeant to write to you on this subject, as he is quite unable to do so himself at present; and trusting you will have the kindness to insert my letter,

"I remain, Sir, your obedient Servant,

"JOHN SLATER.

"20, Rue de la Banque, Paris, Dec. 21.

"Many letters contain a 4d. stamp for an answer. I need scarcely say that English stamps are useless in the French post-office."

The death of the Special Envoy sent by Tuscany to this country as the representative of its new regime has naturally given a renewed stimulus to the public in their desire to see that nuisance called small-pox abated. We call this disease a nuisance, because it may very fairly be comprised under that head inasmuch as it is undoubtedly capable of being abated—if not absolutely removed—like ordinary nuisances. What has been said in reference to the spread of small-pox through the medium of street cabs and public conveyances is, no doubt, all very true; but those who have dilated on the enormity of the evil resulting from this misuse of cabs, etc., have not shown us practically how the custom can be stopped. It is, no doubt, very desirable that all public institutions whose business it is to treat diseases of a contagious nature should have some conveyance at their disposal for the removal from their homes to the Hospitals of persons afflicted with such diseases; but any one at all conversant with disease and its management, and with our great public charities must be well aware that it is utterly impossible to prevent the using of common cabs for the purpose. The sick must be conveyed to the Hospitals, and as they have not private carriages of their own, must necessarily resort to a public

conveyance. How is it possible for a cabman or for the friends to know whether the patient is or is not struck down by a contagious disease? Yet the gentleman—a Surgeon—writing in the *Times*, recommends “that it shall be made penal to let or hire a public vehicle for the conveyance of any person afflicted with contagious disease.” A little consideration will show how utterly impossible it is for the Legislature to interfere in such a case. And then, again, such a regulation not only affects Hospital patients, but all classes of society who do not possess carriages of their own. But there is much that a wise Legislature may do indirectly in this matter. Inasmuch as contagious diseases are preventible diseases, it can direct its energies towards the sources from whence they spread; and can stifle the causes which give birth to them—it can, in fact, strike at the very root of such diseases. In the particular case of Small-pox there is a grand field still open for the exercise of its influence and its powers. If anything, indeed, can *a priori* be considered as demonstrable in matters Medical, it is this: that Small-pox and certain fevers might be eradicated from the face of the earth if men would only strictly follow out the prescribed laws which are founded on experience and have reference to these diseases. We are glad, indeed, to find that the Legislature has lately again turned its attention to the subject of vaccination, and has published a system of regulations regarding the organisation of our present system of vaccination—having for their chief object the more general secure and uniform system of performing the operation of vaccination. We would recommend, under this head, that the teachers of our Students should take this matter in hand, and satisfy themselves that every Student of Medicine, when he leaves his school, is fully able to perform this operation of vaccination. Without concurring in all that is said as to this very simple operation, it is possible that much of the ill success which has been attributed to vaccination has resulted from the circumstance that the operation has been often ill-performed. We are told that there are at present in London four Public Vaccinators who are authorised to give certificates of proficiency in the art of vaccinating. It is to means like these, and not by impossible interferences with cabs, that we hope to see this plague of Small-pox stayed.

Dr. Allen Thomson, Professor of Anatomy in the University of Glasgow, is the new representative of the Universities of Glasgow and St. Andrew's in the General Medical Council in the place of the late Professor Lawrie. The new member is known to have given great attention to the subject of Medical Education, and it is to be hoped that his former connection with Edinburgh will tend to bring about a cessation of the differences which have long divided the interests of the Universities of Glasgow and Edinburgh.

We last week noticed the fact that half-a-dozen school-boys were very nearly fatally poisoned through the eating of Bath-buns, the poison being, as it was stated, chromate of lead, which the ambitious confectioner had mixed with his wares, for the purpose of imparting to them a superlative yellow colour. It now turns out that the yellow poison was neither more nor less than “orpiment,” yellow sulphide of arsenic; and that many other persons besides the aforesaid boys ran the risk of destruction. One of the buns has been analysed by Dr. Griffin, of the Bristol School of Medicine, and he discovers in it this orpiment. It is hard to understand what more poisonings and deaths our Government can require in order that it may feel justified in interfering with what a Druggist would call his liberties and freedom of trade.

REVIEWS.

The Pathology and Treatment of Pulmonary Consumption. By J. H. BENNETT, Professor of the Institutes of Medicine in the University of Edinburgh, etc. Svo. Pp. 221. Edinburgh: 1859.

We are very glad to welcome a second edition of this work. It has already been stamped with the approbation of the Profession, as being a truly philosophic and practical treatise on the Nature and Cure of Pulmonary Tuberculosis. Professor Bennett, we find, is as sanguine as ever in the hope that consumption will one day become a less fatal disease than it now unfortunately is, notwithstanding all our efforts to arrest it. Bennett's hopes seem chiefly to rest, in the bringing about of this improvement, upon an increased attention on the part of the Medical man to physical diagnosis,—so that he may scotch the serpent before it has too closely wound itself around the victim's lungs; *principiis obsta* is his motto. “He trusts that the whole Profession will soon be prepared to admit that pulmonary consumption ought no longer to be considered as one of the *opprobria medicine*. At no distant day he hopes to see a repeal of those rules which, on the ground that their cases are incurable, have prevented the access of all consumptives to certain public hospitals, and other charitable institutions.” —P. 7.

To this edition of his book Professor Bennett has added a chapter on Diagnosis; and he has besides inserted additional cases confirmatory of his views previously expressed concerning the success “of the analeptic or restorative treatment.” Also, throughout he has seasoned his pages with new observations. He has substituted the term “consumption” for that of “tuberculosis,” as thereby indicating more particularly a diseased condition which everyone understands, in ordinary parlance, to be connected with the lungs. The term tuberculosis has “been recently limited by pathologists to the blood-disorder, or constitutional origin of the local disease.” Besides this, Dr. Bennett tells us something of Dr. Horace Green and bronchial injections, and insists upon the high importance of topical applications to pharynx and larynx. He also points out diseased conditions of the nasal passages, which he affirms sometimes produce symptoms which cause them to be mistaken for phthisis. He gives examples of such cases, in which, by local applications to the nasal passages of solutions of nitrate of silver, he has cured his patients of chronic coughs.

With regard to the novel proposition of bronchial injections, Dr. Bennett has had personal experience in their use, and considers that nitrate of silver, if it could only be fairly applied to the mucous membrane of the bronchi, ought to act as well there as we know it does in the case of other mucous membranes. He, however, recommends caution in its use: “The circumstances of his case—[one he is referring to]—are well calculated to produce caution, and induce us to wait for further facts before coming to a conclusion as to the benefits of this practice.”

We particularly recommend attention to those parts of this book which speak of the local treatment of nasal, laryngeal, and bronchial affections, for we believe that many useful and original observations will be found there; and also to the chapter on Diagnosis, where is pointed out especially the diagnostic value of a microscopic examination of the sputum; and also of the *bruit de pot fêlé*. Dr. Bennett is very urgent upon this point of diagnosis; he feels, he says, “persuaded that the general notion of the incurability of pulmonary consumption is mainly attributable to the fact that it is not recognised until it be far advanced; and yet there is, perhaps, no disease which, in the great majority of cases, may be more readily detected by one practised in auscultation.”

We are glad to be able to back the statement made by Professor Bennett in his preface, viz. That to him belongs the credit of having introduced the use of cod-liver oil into this country in cases of phthisis. It is only fair that this should be plainly stated, as Professor Bennett has not always received his due on this point.

Virchow's theory about tubercle, that it is the result of endogenous cell-growth, is stoutly rejected by Dr. Bennett. —Pp. 23 and 31.

As regards treatment, many very judicious remarks will be

found here well worthy of perusal. Our author, at p. 135, and again at 184, cautions the patient against taking *too much* exercise; and prescribes what amount and kind the exercise should be.

We have only alluded to the more important additions which have been made to this work; but, before concluding, feel bound to call attention to the excellence of the woodcuts—to the care with which they have been executed; and have no hesitation in saying that here we have at once a most highly philosophic and very practical account of the pathology and treatment of pulmonary consumption.

Remarks on the Treatment of Consumption, with Notices of Successful and Unsuccessful Cases. By CHARLES THOMASON THOMPSON, M.D. Pp. 25. London: 1859.

Phthisis Pulmonalis and Tubercular Phthisis. By CHARLES JONES HUMPHREYS, Surgeon, etc. Pp. 32. London: 1859.

IF Dr. C. T. Thompson's pamphlet possessed no other charm, it certainly does possess that of novelty. The treatment recommended in the last stage of Tubercular Phthisis is simply to apply ice to the parietes of the thorax, and at the same time to sponge the whole surface of the body with cold water, and to repeat this operation every two or three hours. Under this treatment we are told that the most hopeless cases of phthisis have been cured. The author is candid enough to inform us that although twenty-seven desperate cases have been thus restored to health, yet that three have terminated unsuccessfully. The first death, however, is accounted for by the want of perseverance on the part of the patient, who would almost certainly have recovered if he had survived the treatment.

In Mr. Humphreys' pamphlet the chief novelties are the extraordinary notions of pulmonary pathology which he develops, and the curiously ungrammatical language in which his views are disclosed. All his cases, fourteen in number, were successful, although they presented such formidable symptoms as night-sweats, ægophony (?) whiffy pectoriloquy (?) etc. The style of Mr. Humphreys' brochure may be indicated by the following specimen, the meaning of which we confess our inability to understand:—"These organic changes continuing, the abscess or abscesses surrounding the morbid deposit being expectorated by the act of coughing, which being produced, and kept up by the irritation, the expectoration, which at first was scanty, becomes copious, contains pus (which is discernible by the application of liq. potassa, or by placing it between two pieces of plate-glass, and then applying it before a spirit-lamp, when it will, at least, show the prismoid colours.)"

Blood Disease. By J. VAUGHAN HUGHES, M.D. 8vo. Pp. 132. London: 1859.

ANY person who expects to find in this volume a scientific treatise on Blood Disease will certainly be disappointed. It might be supposed that an author who professedly writes upon this topic would at least allude to such well-known affections as anæmia, pyæmia, leucocythæmia, etc., to say nothing of purpura, scurvy, rheumatism, and other diseases in which the constitution of the blood is certainly altered, and without including the fevers, congestions, hæmorrhages, and scrofula, in which it may be presumed that the constituents of the vital fluid are in some measure changed. But Dr. J. Vaughan Hughes does not trouble himself with any of these matters. He fills his book with common-place remarks upon the influence exercised by the qualities of the blood upon affections of the stomach, liver, and bowels, upon the connexion between blood disease and gout, and upon its relation to diseases of the uterus. He is peculiarly emphatic upon the necessity of a due comprehension of the state of the blood in relation to the pathology and treatment of gout; but the fact is, that that disease is perhaps as well understood by the Profession, and is as well treated in the present day, as any other affection. The author also insists upon the connexion of blood disease with affections of the uterus, whereas that fluid no more affects the womb than any other organ of the body; while, on the other hand, it might be argued with perfect truth, that the morbid conditions of the womb affect all the other structures and fluids of the female system. In fact, alterations in the blood are indubitably the fertile sources

of disease; but they are no more to be specially regarded as the causes of uterine ailments, than they are of diseases of other internal organs. Dr. Vaughan Hughes is very far from possessing any novel, or even correct views, of the real pathology of the blood.

Notwithstanding these remarks, we believe that the principles laid down as to the treatment of some diseases are correct, as far as they go, and appear to be founded on practical experience.

The Epidemics of the Middle Ages. From the German of J. F. C. HECKER, M.D. Translated by B. G. BABINGTON, M.D., F.R.S. Third Edition, completed by the Author's "Treatise on Child Pilgrimages." Pp. 360. London: 1859.

THE original volume containing "Hecker's History of the Epidemics of the Middle Ages," translated by Dr. Babington, was published by the old Sydenham Society; and the work having gone out of print, this new edition, which is the third, has been undertaken by the present proprietors of the copyright. It is unnecessary to do more than to make such an announcement in reference to a work so well known and so highly appreciated as the learned history of Dr. Hecker; and we are sure that many members of the Profession will gladly avail themselves of the opportunity of adding such a volume to their book-shelves.

A Guide to the Treatment of Diseases of the Skin: with Suggestions for their Prevention; for the Use of the Student and General Practitioner. By THOMAS HUNT, F.R.C.S., Surgeon to the Western Dispensary for Diseases of the Skin. Fourth Edition. Pp. 246. London: 1859.

THE present edition of this work has been revised and enlarged, and two new chapters have been added, one on the Vegetable Parasites of the Human Skin, and another on the Doctrine of Metastasis. In other respects the general features of the book remain the same. Mr. Hunt's views on the treatment of Skin Diseases, and his high appreciation of arsenic in almost all these disorders, are already well known to the Profession.

Report of the Directors of the Montrose Royal Lunatic Asylum, Infirmary, and Dispensary, for the Year ending June 1st, 1859. Montrose: 1859.

THIS report contains a satisfactory account of the proceedings of the Lunatic Asylum of Montrose, as well as of the Infirmary and Dispensary in the same city. In the latter establishment it appears that the number of patients labouring under pulmonary diseases has diminished, while the number of fever cases has increased.

WOORARA AND STRYCHNINE. — MM. Martin-Magron and Buisson deny the existence of any antagonism between these two poisons. If, they say, these poisons be not identical, they nevertheless differ only in slight modifications of their effects, which modifications almost always disappear when the doses and modes of their administrations are varied. The woorara, like the strychnine, causes convulsions, by rendering the spinal marrow more excitable; one condition, however, is indispensable to obtain this result, and that is, to poison the spinal marrow before the extremities; while, in order to have no convulsions with the strychnine, the extremities must be poisoned before the spinal marrow. From which it follows, that the woorara and the strychnine paralyse the extremities of the motor nerves. These results of MM. Martin-Magron and Buisson are most important; for, if correct, they directly contradict the *rationale* on which has been founded the treatment of tetanus by woorara; and they show that this poison ought to be altogether banished from therapeutics, as adding only another danger to the danger of the tetanus itself. In addition to this difficulty in the use of woorara, may also be added the observation of Bernard, that mutilated animals are only with great difficulty brought under its influence—the conditions of absorption being apparently altered in them. So many varieties of Woorara are met with, that no satisfactory results can be obtained until the alkaloid *Cufarina* or *Woorarina* is obtained as a standard test.

FOREIGN CORRESPONDENCE.

FRANCE.

PARIS, December 26, 1859.

THOSE of your readers who have been in the habit of seeing the *Journal of Physiology*, edited by M. Brown-Séquard, may remember a paper from the pen of M. Rouget, which appeared in that journal in the numbers for April, July, and October, 1858. In that highly interesting and curious paper, the author entered, at great length, on some of the leading points connected with the erectile organs of generation in woman; arriving at the following general results:—1st. That the body of the uterus presents the structure of a genuine erectile organ, or a veritable spongy body; and that to the ovaries also are attached erectile bulbs. 2nd. That in all the vertebrated animals, and especially in the mammiferous, there exists a special muscular apparatus which embraces the oviduct and the ovarium, so as to determine the adaptation of the former to the latter during the period of ovulation. 3rd. That the bands or bundles of muscular fibres of this apparatus have, with the spongy bodies of the uterus and ovaries, and particularly with their efferent sinuses, such relations that at the moment of their contraction the meshes of the network, so to speak, in the middle of which the veins pursue their course, contracting themselves in every direction, these latter become compressed, and their circulation is more or less stopped. 4th. That the contraction of the muscular apparatus which embraces the uterus and Fallopian tube persisting during the entire period of ovulation, the obstacle to the current of the blood, and the erection of the spongy bodies of the uterus and ovaries, which is the immediate result of this interruption, have the same duration. 5th. That menstruation coinciding with ovulation, it is natural to consider that the former is also the immediate result of the erection of the uterus; a genuine menstrual hæmorrhage never showing itself except in those animals in which this organ exhibits a real erectile tissue. 6th. That, if sexual excitement can, as is exceedingly probable, determine the erection of the uterus and ovaries, it is easy to account for its influence on the simultaneous production of menstruation and ovulation.

In illustration and confirmation of the views put forth in this remarkable paper, M. Rouget makes frequent reference to certain anatomical preparations deposited by him in the Museum of the Paris Faculty, sketches of which, in the form of plates, accompanied the paper in Brown-Séquard's *Journal*. These preparations—let me mention for the benefit of such of your readers as may visit Paris, and who may go to the Museum in search of them,—are not now to be seen in that place, having been lately removed by M. Rouget in consequence of the rough treatment they had been subjected to, either accidentally or through intention, at the hands of some of the guardians of the Museum. They are now at M. Rouget's own house, where any one interested in the subject which they illustrate, can see them and have them demonstrated by their author, whose affability to strangers I can vouch for. The preparations have, no doubt, been much injured, several of them having been broken to pieces; but, by placing the different parts in apposition the general effect is not interfered with. In comparing them carefully with the figures in the plates, accompanying the paper as they appeared in the journal, I can assure those who have examined the latter that what they have seen there is no exaggeration; in other words, that the plates showing the number, disposition, and course of the utero-ovarian veins and arteries, are exact and faithful counterparts of the original. The irregularity, or rather the want of uniformity, in the distribution of the utero-ovarian arteries and veins is exceedingly well illustrated in one of the preparations; it is there shown that while on a level with the body of the uterus, and at the points corresponding with the insertion of the Fallopian tubes, the branches divide suddenly into from twelve to twenty *bouquets*, twisted, interlaced, and distinctly spiral, while throughout the entire neck of the organ the branches given off are comparatively few in number, and can hardly be said to be spiral at all. A similar peculiarity is remarked in the distribution of the *ovarian* artery: it passes along the ligament, giving off

in its course very few branches, until it reaches the body of the ovary, where numerous branches take their origin, and slip into its parenchymatous substance in the same spiral form as observed on the body of the uterus. As to the corresponding veins of the uterus and ovaries, they are represented as so numerous, so large, and so closely interwoven, that on examining the preparation you can hardly imagine space for the existence of any other tissue. The difference between the strictly spongy character of the uterus proper and its comparative absence in the neck of that organ, is exceedingly well illustrated in a preparation made from a little girl, ten years of age. In this preparation the body of the uterus is covered with a perfect network layer of veins, beautifully delicate, while the neck of the organ is comparatively free from them.

The peculiar muscular apparatus, alluded to in the paper in question—whose use is to bring about the adaptation of the fimbriated extremity of the Fallopian tube with the ovary during the erection of these organs, and which M. Rouget has the merit of having been the discoverer, and the first to demonstrate—cannot, of course, from the extreme delicacy of its fibres, be shown in a dried specimen; but M. Rouget is always ready and happy to show it to those interested in this highly important physiological question, if they only afford him the time necessary to secure a uterus and its appendages in a fitting condition. The organs of a woman who may have died during menstruation, or shortly after delivery, if they can be procured, are the most suitable for such a demonstration. The maceration of the tissues, in which the muscle exists, in acetic acid, or in very highly diluted nitric acid, will very materially facilitate the demonstration of the fibres, and their peculiar fan-like disposition.

Some three weeks ago, while in the female ward of M. Follin, at the Hôpital Necker, that gentleman called my attention to a case which he designated as one of *diabetic cataract*. This expression, although it sounded somewhat strange to me, I paid no particular attention to, believing that he simply alluded to a case of cataract occurring in connexion with diabetes, under which the patient was labouring. Whether M. Follin believes that there is a certain peculiarity in the form, character, and progress of cataract occurring in diabetic patients serving to distinguish it from other kinds of that affection, I do not know; but on reading the paper of Dr. France, of Guy's Hospital, which appeared in the *Medical Times* of Dec. 17, it struck me that perhaps M. Follin laid particular stress on the qualifying term, *diabetic*, when he pointed out the case to me. In referring to my Hospital memoranda, taken on the day in question, I find the following notice of the case:—"Case of Diabetes, with Cataract.—A woman, aged 45, unmarried; symptoms of diabetes commenced eighteen months ago, which have been steadily increasing in intensity. At present there is great debility, with much constitutional disturbance; on her feet are sundry sphacelated spots, each about the size of a shilling; the urine is excessive in quantity, and contains a great deal of sugar. For the last three months has complained of dimness of vision, both eyes being equally affected. Without the aid of the ophthalmoscope, no change in the lens can be detected, but this instrument reveals what appears to be a soft cataract in each eye." It is a matter of regret to me, that this patient is no longer in the Hospital, as, since reading Dr. France's paper, I feel a certain interest in the solution of the question to which his remarks have given rise. In the course of conversation with M. Sichel (perhaps the highest authority in France, and whose reputation is certainly European), he remarked to me that he had frequently met with cataract in connection with the diabetic constitution, but that he had never observed the peculiarities ascribed to it by Dr. France. M. Sichel, however, does not deny the probable existence of these peculiarities; but he candidly admits that, in examining a patient, he should be unable to say, simply from its appearance, form, and progress, whether a cataract was diabetic or otherwise.

EDINBURGH OBSTETRICAL SOCIETY.—At the election meeting, held on the 14th inst., the following gentlemen were appointed office-bearers:—President: Alexander Keiller, M.D. Vice-Presidents: T. Graham Weir, M.D.; George S. Keith, M.D. Secretaries: James A. Sidey, M.D.; Alex. R. Simpson, M.D. Treasurer: James A. Sidey, M.D.

GENERAL CORRESPONDENCE.

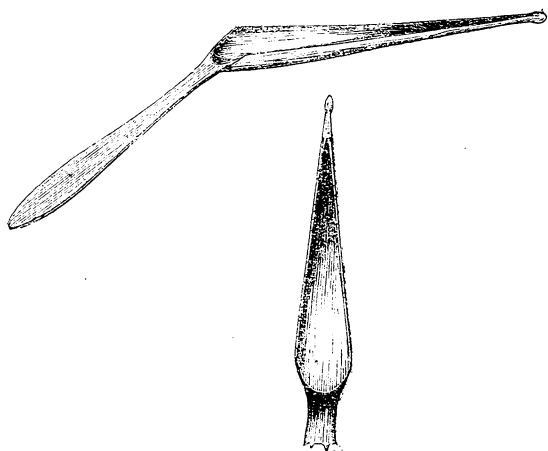

ON A PROBE-GORGET FOR MEDIAN LITHOTOMY IN CHILDREN.

LETTER FROM MR. TEALE.

[To the Editor of the Medical Times and Gazette.]

SIR,—Since you did me the favour to publish my paper on "Stone in the Bladder," in your Journal of December 10, a little boy, aged two years and nine months, suffering from stone, was admitted into the Leeds Infirmary under my care.

Before operating I requested Mr. T. Eagland, of Leeds, to make me a probe-gorget, as a guide for the finger into the prostatic urethra. The blade of this instrument is three inches in length, and may be described as a hollow half-cone, three-fourths of an inch in diameter at its base, terminating at the apex in a bulbed probe half-an-inch long.

PROBE-GORGET.—The proportion is exactly two-fifths of real size.

I operated on this child on December 17, and removed a stone the size of a chesnut, or, to speak more definitely, two and a-half inches in its smaller circumference, and three and a half in the larger.

The instrument easily glided along the groove of the staff so far as to allow the tip of my left forefinger to be lodged within the prostate. The finger was then pushed onwards while the guide was withdrawn. The tip of the finger readily touched the stone, which was seized and extracted with perfect ease, the operation being completed in little more than one minute. The child has not ailed anything since the operation, and at the end of a week is playing cheerfully in the ward.

As it is evident that the median operation will receive extensive trial, it is important to come to an early decision as to its details. In the hope of promoting this object, I venture to add another to the various instruments already submitted to the Profession by Mr. Bowman, Mr. H. Thompson, and Mr. Armstrong Todd.

The instrument, which I have now described, has been found practically efficient in the removal of a large stone from a young subject. My colleagues and others who were present at the operation have kindly expressed their full approval of it. It thus appears that a probe-gorget has been employed in median lithotomy both by Mr. H. Thompson and myself, quite independently of each other, and with a satisfactory result in both instances.

In conclusion, I beg to offer the two following remarks:—

1st. That the "probe-gorget" here recommended, as well as the instruments recently described by Mr. Bowman and Mr. H. Thompson for use in children, should be regarded less as dilators than as guides for the finger, which in young subjects is the real dilator.

2nd. That the name of "prostatic dilator" is more strictly applicable to the instrument described in my paper of December 10, and I presume also to Mr. Armstrong Todd's instrument described in the *Medical Times and Gazette* of Dec. 24.

Leeds.

I am, &c. THOMAS P. TEALE.

THE NEW MEDICAL ACT A DEAD LETTER.

LETTER FROM MR. STEELE.

[To the Editor of the Medical Times and Gazette.]

SIR,—I wish to direct attention to the case under the Medical Act, reported in your columns, which was heard before Mr. Mansfield, stipendiary magistrate for the Borough of Liverpool, in which it was proved that the defendant Hamilton had signed a Medical certificate of the cause of death, adding to his name the title, "Surgeon of the College of Boston, U.S.;" also, that he had acted as a Surgeon by visiting, giving medicine, etc., for which he was paid; and although these facts were not contradicted, the case was dismissed, on the ground that the defendant did not pretend he was registered under the Act, but on the contrary, that he had guarded himself against such an assumption by the addition of the title, "College of Boston." If Mr. Mansfield's interpretation of the Medical Act is sound, then that measure becomes a dead letter so far as quacks and unqualified persons are concerned, inasmuch as they can, in the easiest possible manner, evade the provisions of Sect. xl. No act of practice, no assumption of title, renders them amenable to the law, unless they expressly imply that they are registered under the Act.

Contrasting the decision in this case with that in *Fitzpatrick v. Hallows*, it appears that the operation of the Medical Act is to restrict the privileges heretofore enjoyed by qualified Practitioners; while, on the other hand, it affords protection to quacks and unqualified persons, permitting them to practise and use any titles they please so long as they do not pretend to be on the Register. Surely this anomaly cannot be suffered to continue. Unless the appeal which will be made to a higher Court reverses Mr. Mansfield's decision, no time should be lost in urging upon the Government the importance of so amending the Act that the intention of its framers can no longer be evaded by a mere legal quibble. If this case is a fair interpretation of the law, the public and the Profession would be far better without any Medical Act at all, than with such an ambiguous and vaguely-worded statute.

I am, &c.

A. B. STEELE,

Hon. Sec. Liverpool Medical Registration Association.

INOCULATION OF STRYCHNINE.

LETTER FROM DR. REID.

[To the Editor of the Medical Times and Gazette.]

SIR,—The following case may prove interesting to many of your readers should you deem it worthy of a place in your columns:—

December 9, 1859.—Mr. S—, a middle-aged, corpulent man, while mixing some strychnine with meal to poison rats, accidentally allowed the mouth of the bottle containing the poison to come in contact with a small abrasion of the cuticle on the last phalanx of the thumb. He took no particular notice of it at the time, but had good cause to remember it afterwards, as the sequel will show. In about half-an-hour he washed his hands, and immediately felt a sense of numbness extending from the thumb to the whole of the hand and wrist, and rapidly to the elbow and shoulder. He then became alarmed, being well acquainted with the deadly nature of the drug, and I was sent for at midnight. Two hours necessarily elapsed before I could reach him, as he lived many miles in the country. I found considerable swelling of the joints of all the fingers, and also of the wrist, but all numbness had passed off, and there was no appearance of inflammatory action about the wound (which, by-the-by, was so small as to be hardly discernible). He (Mr. S.) informed me, that at the time he despatched the messenger, his arm was "enormously swollen, and so dead that he could bang it against the wall without feeling it." There had been no rigidity of the muscles of the back, or any morbid symptoms but those already mentioned. On the following day the arm had recovered its normal size and appearance.

These particulars may be useful in causing those who manipulate with the drug to be careful that all scratches on the hands, however insignificant, be well protected.

I am, &c. DOUGLAS A. REID,

M.D. Edin.; M.R.C.S.; L.A.C.

Pembroke, December 11, 1859.

LIVERPOOL POLICE COURT.

December 21, 1859.

BEFORE J. S. MANSFIELD, ESQ., STIPENDIARY MAGISTRATE.

LIVERPOOL MEDICAL REGISTRATION ASSOCIATION *versus* JOHN HAMILTON.

(Mr. Deighton, Barrister, appeared for the Prosecution; Mr. Husband, Attorney, appeared for Mr. Hamilton.)

Mr. DEIGHTON said: This is a prosecution for a breach of the fortieth section of the Medical Act, 20 and 21 Vict., cap. 90, and the defendant is charged with having falsely implied that he was registered under this Act, by having assumed and signed himself a Surgeon and thus pretended that he is recognised by law as a Surgeon whereby he has incurred a penalty of 20l.

Mr. HUSBAND: Before you go further we wish to know who is the prosecutor in this case.

Mr. DEIGHTON: The prosecutor is Mr. Arthur Browne Steele, Honorary Secretary to the Liverpool Medical Registration Society, and prosecutes on the part of the Society. It appears that on November 29 in the present year, a woman named Margaret Caldwell was ill, and her husband proceeded to 94, Mill-street, the residence of the defendant, and his place of business, to ask him to visit her. He told her husband he would come and he went to his house; he charged 1s. 6d. for the visit. He told Caldwell he was a Surgeon. Having looked at the woman, he gave instructions and said he would call again. The woman died that night; that was on the 29th of November. Next day her husband called upon him in relation to the burial, and the defendant undertook to give him a "medical certificate" of the cause of death, which was in these terms:—"I hereby certify that I attended Margaret Caldwell, late of Grafton-street, that died on the 29th day of November; immediate cause, effusion of blood on the brain, produced by excess in drinking rum. Signed, J. Hamilton. Profession, Surgeon of the Medical College, Boston, U.S. Residence, 94, Mill-street. 30th day of November, 1859." That was the case, and he apprehended that if he proved these facts in evidence, the court would have no doubt the defendant had assumed a name and description implying that he was registered under the Act referred to; that he falsely called himself a Surgeon under this Act, and had incurred a penalty of 20l. Mr. Deighton called Mr. A. B. Steele who said: I am hon. secretary to the Liverpool Medical Registration Association. I produce a copy of the Medical Register. I have carefully examined it, and I do not find the name of John Hamilton, the defendant, on it. The witness was not cross-examined.

JAMES CALDWELL examined: I am a boiler-maker and reside at 167, Grafton-street, in Liverpool. I know Mr. Hamilton, the defendant. I called at his shop in Mill-street to ask him to come and see my wife; he attended her the same day. He charged for his attendance; he charged 1s. 6d. for going to see her; I got medicine from him; I paid him, for attendance and medicine, 7s. 6d. He told me what to do, and she died at eleven on the same night, the 29th November. I went to him again, and got a paper from him. I went to him about the burial. I did not look at the paper, but I took it and folded it up and went to the Registrar of Deaths. I handed him the same paper I got from the defendant. He told me he was a surgeon. I heard him say that he was a surgeon of the College of Boston, United States. The certificate was produced, and

HENRY BUCKMASTER was examined: I am Registrar of Deaths for the Toxteth-park District, in which Grafton-street is situated. On the 30th November last Caldwell, the last witness, handed me this certificate. Certificate put in.

Mr. MANSFIELD: It appears to me doubtful whether this paper sustains a charge of having violated the Act. The section seems loose, though its intention may be plain enough. The question is, has he implied that he is registered under the Act.

Mr. HUSBAND: That is what we say.

Mr. DEIGHTON: I think myself the Act is very loose, and my opinion on reading it was like yours. But there is evidence of his calling himself a Surgeon.

Mr. MANSFIELD: He calls himself a Surgeon, but he does

not hold out that he is registered under this Act. This certificate rather negatives the inference. Mr. Thomas, the bone-setter, and others not registered, do certain things, and no doubt may do good, but they do not violate the law.

Mr. DEIGHTON: The Section says that no one shall hold himself out to be a Physician, or Doctor of Medicine, or Licentiate in Medicine, or Surgeon, or Bachelor in Medicine, or General Practitioner, or any name implying—

Mr. MANSFIELD: The only disqualification seems to be that the person practising is not registered, and shall not imply that he is. Does the evidence show that he has?

Mr. DEIGHTON: The question is whether he is not acting as a Surgeon by giving that certificate. He is not registered under the Act.

Mr. MANSFIELD: Does he say so? I think not.

Mr. DEIGHTON: There is another case against him.

ELIZABETH KENYON called: I know Hamilton, the defendant. My husband was ill on the 8th December, inst., and I went to defendant's shop to ask him to come and see him. He came, and ordered me what to do. He said he was a Surgeon. He gave a certificate (paper handed to witness, who identified it). He said he was a Surgeon of Boston College. He charged for his visits. (Certificate not put in.) The following is a literal copy:—

"December 8, 1859.

"I certify that J. Kenyon is unable to attend his *employment* in consequence of an *inflation* of the *plura*."

Summonses dismissed.

Mr. DEIGHTON: I am instructed to ask your worship to grant me a case in this matter, to have the opinion of a higher tribunal.

Mr. MANSFIELD: Certainly. There seems no doubt that the Act has been evaded, and the opinion of a higher court should be taken.

Mr. HUSBAND: Not at all.

Mr. MANSFIELD: The intentions of the framers of the Act seem to be evaded.

Case granted as required.

In the course of the proceedings the following card was handed to the magistrate, but though put in was not read:—

"J. Hamilton, Member of the Reform College of Surgeons, Boston, U.S., Practitioner of Medical Botany, Proprietor of the Botanic Dispensary, 94, Mill-street. . . . Mr. Hamilton may be consulted gratis daily on all Diseases of the Human System from 10 am. to 10 p.m. . . . N.B.—Mr. H., being a qualified man, visits Patients at their residences, and can give Certificates when necessary, etc."

OBITUARY.

DR. MONTGOMERY.

LAST week we announced the death of the above distinguished member of our Profession, intelligence of his decease having reached us just as we were going to press. William Fetherston H. Montgomery, whose name, to use the words of Dr. Arneth of Vienna, "is known and honoured wherever midwifery is practised," received his education in the University of Dublin, having entered Trinity College in the year 1817 under the Rev. Dr. Wall, the present learned and venerable Vice-Provost of the University. In 1820 Mr. Montgomery obtained a scholarship, a prize within the reach only of those whose classical attainments are of the highest order. He graduated as A.B. in 1822, and took the degrees of A.M. and M.B. in 1825. He did not take the degree of M.D. until 1852. He became a licentiate of the King and Queen's College of Physicians in 1825, and in 1829 he was elected a fellow of that body. He subsequently filled the office of President of the College. At an early period of his professional career, Dr. Montgomery gave lectures on midwifery to large classes of pupils at his house in Cuffe-street, Stephen's-green. To his exertions the foundation of the Professorship of Midwifery by the College of Physicians was mainly due, and he was himself the first elected to the chair he so ably filled during the lengthened period of thirty years. As a lecturer, his style was particularly clear and pleasing, and he had peculiar facility in communicating to his hearers the copious inform-

ation he himself possessed. His address on the resignation of his Professorship is to be found in the pages of this Journal. Dr. Montgomery's contributions to Medical, and more particularly to obstetrical, literature were numerous and varied. They are to be met with chiefly in the first and in the present (or second) series of the *Dublin Journal of Medical Science*. In addition he contributed to the *Cyclopædia of Practical Medicine* the articles "Personal Identity," "Signs of Pregnancy and Delivery," "Rubeola," and "Succession of Inheritance-Legitimacy." But it is on his classical work on the "Signs and Symptoms of Pregnancy," and on his observations on the spontaneous amputation of the foetal limbs in utero, that Dr. Montgomery's lasting fame must mainly rest. In the former especially he has erected to his own memory a "*monumentum ære perennius*." We have too recently recorded our opinion of this great work, to render it necessary to return to it on the present occasion. To his indefatigable zeal in the cultivation of science the extensive Obstetric Museum, the work of his own hands, formerly preserved in the College of Physicians, but now enriching Queen's College, Galway, will, it is to be hoped, long testify. Dr. Montgomery was sixty-two years of age. His death, though not unexpected was rather sudden: he had for some time suffered from excruciating pains in the chest, and other symptoms of cardiac disease. His decease, as we have already stated, occurred on the morning of Wednesday, December 21st, 1859, at his residence in Merriion-square. Dr. Montgomery was an honorary member of several foreign Medical Societies.

MEDICAL NEWS.

ROYAL COLLEGE OF PHYSICIANS.—At the Comitia Majora held on Thursday, December 22nd, the following gentlemen, having undergone the necessary examination, were admitted members of the College:—

Bridges, John Henry, M.B., Victoria-square, Fimlico
De Grave, John Francis, M.D., Fetcham
Liveing, Edward, M.B., Park-terrace, Highbury

Also on Wednesday, December 28, the following gentlemen were admitted Members of the College under the temporary Bye-Laws:—

Andrews, John, Royal Navy
Barry, John O'Brien Milner, M.D. Tunbridge Wells
Blake, Charles Paget, M.D. Torquay
Budd, Samuel, M.D. Exeter
Bury, John, M.D. Chester
Carter, Thomas Albert, M.D. Leamington
Daly, Owen, M.D. Hull
Davidson, James, M.D. H.M.S. *Wellesley*, Chatham
Dolton, William Blucher, M.D. Upper Montagu-street
Evans, Thomas, M.D. Gloucester

Wade, Willoughby Francis, M.B. Birmingham

APOTHECARIES' HALL.—Names of gentlemen who passed their Examination in the Science and Practice of Medicine, and received Certificates to Practise, on Thursday, the 22nd of December:—

Cumpstone, William, Market Rasen, Lincolnshire
Firth, Joseph Thomas Forbes, Cherry Garden-street, Bermondsey
Hayward, John Robert Samuel, Lodway, near Bristol

Hoyle, Richard Elkanah, Heighington
Lumsden, William, Hull, Yorkshire
Pout, Frank, Yalding, Kent
Pugh, Hugh Lewis, Dolgellau
Tebay, Michael James, Eastwell, Melton Mowbray, Leicester
Trotter, Charles John, Holmfirth, Yorkshire
Wigg, Thomas Carter, London

The following gentlemen also on the same day passed their First Examination:—

Fuller, William Francis, Bridgewater, Somerset
Lomas, Henry Wright, Swinton-street, Gray's-inn-lane
Owens, Henry, Croydon, Surrey
Tanner, Robert, Gloucester House, Ledbury
Williams, John, Doncaster, Yorkshire

As Assistants:—

Barkway, Walter Frederick, St. Bartholomew's Hospital
Lowe, John, 2, Clarence-street, Greenwich

ARMY OF INDIA.—List of Assistant-Surgeons passed for the Army of India, December, 1859, arranged in order of merit:—

Brothie, A. R.
Emanuel, Leonard
Jameson, G. W.
Cookson, Henry
Cunningham, Robert W.
Carter, Robert
Moir, William
Skardon, T. G.
Williamson, George
Turnbull, William
Parker, C. R. G.
Fulliott, John
Ronaldson, Hugh
O'Brien, Daniel
Taylor, J. Herbert
Alleyne, R. A.
Kearney, Daniel

APPOINTMENTS.

SCURRAH.—J. D. Scurrah, M.D. Lond. has been elected one of the Physicians to the Islington Dispensary, *vice* Dr. Burnie, resigned.

WOODWARD.—Mr. Wm. Woodward, formerly Resident Medical Officer to the City of London Hospital for Diseases of the Chest, Victoria-park, has been appointed to the office of Visiting Surgeon and Secretary to the Worcester Dispensary.

DEATHS.

BEDDOME.—December 26, at Romsey, where he had practised for half a-century, John Reynolds Beddome, M.D.

EVANS.—December 23, of rheumatic fever, Alfred W. A. Evans, Student of Medicine.

HISCOX.—December 25, at Grosvenor, Martin Thomas Hiscox, M.D., Fellow of the Royal Medico-Chirurgical Society, and F.R.C.S.

KIRKWOOD.—November 19, at Pictou, Nova Scotia, Dr. Edward F. G. Kirkwood, aged 51.

PYNE.—December 16, William Collard Pyne, Wellington, Somersetshire, aged forty-five.

SCOTT.—December 20th, at South Bush, Musselburgh, James Scott, M.D., Deputy-Inspector of Hospitals and Fleets.

THOMPSON.—December 15, at Dalkeith, from typhus fever, caught in the wards of the Royal Infirmary, James Thompson, Medical Student, aged twenty.

DR. DORAN relates that the Countess Von Platen—one of our George's mistresses—was in the habit of taking milk baths, and by way of utilising her extravagance presenting the milk to the poor.

In Austria there are 330 Public Civil and 159 Military Hospitals, relieving about 400,000 persons a-year; 40 Lunatic Asylums, with their 6000 inmates; 40 Maternity Hospitals, with their 60,000 births per annum; 33 houses for Enfants-Trouvés, with 24,000 infants.

GLYCERINE, says M. Demarquay, applied to diseased cutaneous surfaces may modify their vitality as in eczema, may remedy the state of painful tension of the skin which exists in erysipelas, and the dryness of the epidermis in pityriasis and ichthyosis; it opposes the thickenings and splittings of the tissues in lichen and psoriasis; it appeases the painful sensations of pruriginous affections; prevents the formation of scabs; acts favourably on the ulcerations of pemphigus and rupia; diminishes over-secretion from the skin, and destroys its bad odour.

THE PRACTICE OF MEDICINE IN CHINA.—Dr. Scherzer gives some interesting details on this head. Among their medicaments, alum is particularly mentioned as used for an emetic; arsenic serves for caustic; borax is employed

in the cure of ulcers. Infusions of camomile are common; camphor is added in large quantity to numerous remedies for abscess; castor-oil is only used externally, and especially in female complaints. Quinine is almost exclusively used as a means of combatting the passion for opium smoking; infusion of canella is administered in cases of asthenia and stomach complaints. Linseed is held to be a calminative in painful evacuations. Ginger is used against all sorts of pains; Glauber's salts as purgatives; chalk combined with other ingredients in hæmorrhages. Musk is frequently given as an abortive agent; opium to combat diarrhoea and abdominal pains; rhubarb is the favourite purgative. In cough, inhalations of datura are employed; and sulphur is prescribed for itch and the exanthemata. The Chinese, in general, grow quickly old; because they marry very young—being often grandfathers at forty. Puberty is later in the Chinese than in Europeans, and very often the menses do not appear until one or two years after marriage. Of fifty women, married between seventeen and twenty, and of whom one only had had children, two only had menstruated at seventeen; the rest at nineteen or afterwards. The wives of the upper-class Chinese are strictly watched; and it is said that the custom of compressing their feet is due to the jealousy of the husband, who thinks to find in the difficulty of locomotion thus produced a guarantee for the fidelity of the wife. Polygamy is rare in the lower classes. Generally speaking, the women are fruitful; but the men are so enfeebled by polygamy, that many of them who possess eight or ten wives are without children. Suckling of children is continued up to the third, fifth, and even tenth year. The barbarous custom of exposing children in the public roads, etc., still exists. The mortality of their infants equals or surpasses that of infantile mortality in Europe. Small-pox and tetanus carry off many at an early age; afterwards they succumb to cholera and dysentery. Syphilis is very common in both sexes, and often commits great ravages, little being done for its cure. Many, between eight and twenty, suffer from ague, for which the Chinese have no specific remedy.—*Clinique Europ.*

VITAL STATISTICS OF LONDON.

Week ending Saturday, December 24, 1859.

BIRTHS.

Births of Boys, 961; Girls, 807; Total, 1768.
Average of 10 corresponding weeks, 1849-58, 1477.9.

BOOKS RECEIVED.

- Descriptive Catalogue of the Preparations in the Museum of St. Thomas's Hospital. Edited by Sydney Jones, F.R.C.S. London: 1859.
- Lectures on the Development of the Gravid Uterus. By W. O. Priestley, M.D. London: 1860.
- Essays in Medical Science. By James Cappie, M.D. Edinburgh: 1859.
- On Excision of the Knee-joint. By Oliver Pemberton. London: 1859. (A reprint of a useful paper from the "British Medical Journal.")
- Transactions of the Philosophical Institute of Victoria. Melbourne: 1859.
- The Treatment of Aneurism by Compression. By S. A. Cusack, M.B., F.R.C.S. (A reprint of a practical paper from the last number of the "Dublin Quarterly.")

On Certain Popular Fallacies Concerning the Production of Epidemic Diseases. By Daniel Noble, M.D. Manchester: 1859. (An important paper read before the Manchester Statistical Society.)

Causes of Irregularity of the Permanent Teeth. By James Robinson, D.D.S. London: 1859. (A reprint of a useful paper from the "Dental Review.")

Deafness, its Causes and Cure. By T. R. Mitchell, M.D., F.R.C.S. Liverpool: 1859.

The Mineral Springs of Vichy. By A. B. Granville, M.D., F.R.S. London: 1859.

Delia Natura e dell' Arte nella cura del Morbo. Naples: 1859.

DIARIES FOR 1860.

Messrs. Letts and Co. have forwarded us three specimens of their Diaries. The "Medical Diary" and the "Appointment Diary" are both well adapted for Medical men.

Messrs. Smith have also sent their well-known "Visiting List." By successive improvements they have at length arrived at a standard form which is generally acceptable.

TO CORRESPONDENTS.

In the First Volume of the

Medical Times and Gazette

For 1860,

D. R. SIMPSON'S

CLINICAL LECTURES ON THE DISEASES OF WOMEN

WILL BE CONTINUED, INCLUDING

OCCASIONAL CLINICAL LECTURES ON CASES IN OBSTETRIC SURGERY.

CRANIOCLASM—A NEW FORM OF CRANIOTOMY.

FIBROID TUMOURS AND POLYPI OF THE UTERUS.

INFLAMMATORY AFFECTIONS OF THE UTERUS AND VAGINA.

DISPLACEMENTS OF THE UTERUS.

DISEASES OF MENSTRUATION.

PHYSICAL DIAGNOSIS OF DISEASES OF THE UTERUS, OVARIES ETC.

SURGICAL OPERATIONS ON THE VAGINA AND PERINEUM.

ALSO, A COURSE OF LECTURES

ON EXPERIMENTAL PATHOLOGY AND OPERATIVE PHYSIOLOGY,

DELIVERED DURING THE PRESENT WINTER SESSION,

(Specially reported for this Journal, and corrected by the Lecturer,

BY PROFESSOR CLAUDE BERNARD,

Member of the Institute of France, Professor of General Physiology at the Faculty of Sciences.

AND OCCASIONAL LECTURES

BY

EMINENT LONDON TEACHERS.

In the same Volume,

A SERIES OF PAPERS WILL APPEAR

BY D. R. CONOLLY,

ENTITLED

RECOLLECTIONS OF VARIETIES OF INSANITY.

THEY WILL COMPRISE:

I. RECOLLECTIONS OF HANWELL;

AND

II. CONSULTATIONS.

Each Paper in the Second Part will treat on some Group of Affections, as—

JUVENILE INSANITY,

SENILE INSANITY,

VARIETIES OF INSANITY WITH PARALYSIS,

UTERINE AND OVARIAN CASES.

Mr. Lizars' letter on the Treatment of Hydrocele is also delayed.
r. Aldis's case of Poisoning by Lead-lotion, shall appear next week.
Dr. Warwick's case shall appear. The delay has been purely accidental.
Mr. C. Thompson's letter on Fibrinous Clots in the Heart in Diphtheria shall appear next week.
Dr. Williamson's reply to Dr. Adams on Fœtal Auscultation is unavoidably postponed until next week.
Anti-Menthanodyne.—Such ridiculous puffy circulars are truly contemptible, but are hardly worth serious notice.
Balneum does not say if he wants a work on English or German baths.—Probably those of Dr. Granville, or Dr. Edwin Lee, might answer his purpose.
Mr. Hall.—The only book we can hear of likely to suit our correspondent is "Wood's Tourist's Flora," published by Reeve, price eighteen shillings.
J. G.—The puff appears to us to be very direct. If Dr. Wardrop sanctioned the paragraph, it was a mark of something more than indiscretion; but it must be remembered that these things are often done by well-meaning but mistaken friends.
Mr. A.—The Spanish cure for nymphomania to which we alluded some weeks ago, reminds us of a story told by M. Ricord, in his lectures. A father, anxious for the morality of his son, requested M. Ricord to give his son a sight of the "horrors" of the Hôpital des Vénériens. M. Ricord readily complied with his desire; and on asking of the son after his visit as to the moral impression made upon him, received the reply, "Sir, the patients here seem to me to be very happy and merry, and if they have had the misfortune to catch a bad disease, they appear to be all rapidly recovering under your treatment. What I have seen much lessens the dread which I have had of catching the disease."

FATTY INJUNCTION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Can you inform me what is the manner in which simple ointment is supposed to act, when rubbed into the skin? I see that it is used in France to prevent peritonitis. In a late number of the *Gazette des Hôpitaux* M. Manec after operating in a case of hernia, ordered frictions to be made with warm unguents over the whole of the belly of the patient, which was then to be covered with flannel. M. Manec ordered these frictions with the idea of combating any disposition to peritonitis which might exist.

I am, &c. PHILLO.

FRENCH ORTHOGRAPHY.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—You sometimes amuse your readers by the orthography of our French friends, when they deal with our English names. In a late number of the *Gazette Médicale* I see a summary of papers, etc., which have appeared in your journal; and, in about as many lines, I find the following number of your friends and contributors thus interpreted: M. James Faget, M. Arnolt, M. Wordworth, M. Dakers, M. Roberto, M. Jouis Snow, M. Payne Coton, M. Wharthon Jones, M. Crocker, M. Whille, M. Grunhauser. There is really something curious in this determined method of ill-treating our names when the printed document from which they are taken lies before the scribe, who thus mal-scribes them.

I am, &c. HIC.

THE NAVAL MEDICAL SERVICE.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—I enclose for your information and that of your readers, an extract of a letter from the Australian Station, giving an account of the brutal conduct of Commodore Loring, of the *Irre*, respecting the burial of a Naval Surgeon under his command; and the handsome conduct of the military on that occasion. The letter needs no comment from December 26th.

A NAVAL SURGEON.

EXTRACT OF A LETTER FROM THE AUSTRALIAN STATION, PUBLISHED IN THE "UNITED SERVICE GAZETTE" OF THE 24TH OF DECEMBER.

"I have a sad story tell you of to-day's proceedings. The Surgeon of the *Cordelia*, D. H. Wright, M.D. (who was a very superior person, and much esteemed by all), died the night before last from consumption, and was buried to-day. Commander Vernon, of the *Cordelia*, called on the Commodore yesterday, and acquainted him of the death of his Surgeon, and was answered,—"Oh never mind him, we can get a hearse and bury him after you are gone;" and Commander Vernon received orders to sail the same evening, or at the latest to-day, for the Feejees.

"However, the officers of the Artillery heard of this, and, as the Commodore declined to do anything, they procured a gun-carriage and horses and their band. The Colonel of the 12th Regiment sent a large firing party, and all the officers who were not on duty, from the Colonel commanding the garrison down (about nineteen in all) attended. The naval Commodore pooh-poohed the whole thing, and actually went to a wedding party while the Surgeon was being buried! Nor was this all. He would not allow either the Surgeon or Assistant-Surgeon to attend their brother officer's funeral; he compelled one to remain on board, and would not send a single blue-jacket or marine, or in any way take official or private notice of the funeral of the Naval Surgeon of a ship under his command. The Artillery and the 12th Regiment did everything. These things are calculated to make one very much ashamed of one's service."

POOR-LAW MEDICAL REFORM ASSOCIATION.

TO THE EDITOR OF THE MEDICAL TIMES AND GAZETTE.

SIR,—Not having, like Mr. Richard Griffin, the pen of a ready writer, I have failed to convey to the mind of that gentleman my ideas on the subject of Poor-Law Medical Reform; although he has evidently pretty well comprehended my views of his so-called Association, to the correctness of which he by silence seems to assent. Yet if he will bear with me this once also, I will try to explain to him, first, what I mean by "a real

and simple organisation." I mean that we (the Poor-Law Medical officers) should organise ourselves into a genuine Reform Association, which should possess the characteristics of other associations. To wit—regular meetings, regular and definite subscriptions, elected office-bearers, laws and regulations for our guidance, and a settled plan of action. We could then, by means of local or branch meetings, after the fashion of those of the British Medical Association, thoroughly discuss our grievances and their remedy, and determine among ourselves what we really want and have a right to demand.

Secondly. When I say "Mr. Griffin is just the man to do this if he will but set about it," I mean that from his energy, his activity, experience, and justly-acquired influence, he is the man to originate and consolidate such an organisation, and if he will at once sketch a short scheme of such an association and place it in the hands of fifty or sixty men in different localities, asking them to call together their brethren, each in his own neighbourhood, and endeavour to obtain their adhesion, etc., I have no doubt of his rapid and complete success in forming a large and substantial association,—a necessary and essential first step towards ultimate success.

Thirdly. I mean that from such an association we might expect would come forth, in due time, "a well considered and matured scheme" of Poor-Law Medical Reform, "acceptable to ourselves and reasonable and feasible too." Poor Paul Jones has no such "inestimable blessing" to lay before the public; he knows better than to try his 'prentice hand at a work in which the veteran Griffin has confessedly failed, and which he believes to be beyond the capabilities of any one individual mind.

Lastly. I cannot allow Mr. Griffin to judge for me in my own private affairs. I believe he is mistaken when he says I had better enter the lists fairly by signing my real name. I am sure we should not then be on equal terms, for Griffin *versus* Paul Jones would be as mastodon to mouse.

I have no personal claim to the confidence of the Poor-Law Medical Officers, and my suggestion must rest on its own merits alone. If he needs another reason, let me whisper in his ear that I am not permanently appointed, and he will then understand that were I publicly to appear as an agitator in such a cause my next grievance would probably be peremptory and arbitrary dismissal.

Dec. 21, 1859.

I am, &c.

PAUL JONES.

COMMUNICATIONS have been received from:—

Professor SIMPSON; M. CLAUDE BERNARD; Dr. CONOLLY; Dr. WEST; Mr. J. R. MARTIN; Dr. HARE; Mr. TEALE, Leeds; Mr. STARTIN; Dr. OGLE; Mr. HENRY THOMPSON; Dr. RICHARDSON; Dr. GRANVILLE; Dr. GRAILY HEWITT; Dr. TANNER; Mr. LIZARS, Edinburgh; Dr. WILLIAMSON, Aberdeen; Mr. FRANCE; Dr. JOHNSON; Mr. HAYWOOD; Dr. GREENHOW; Dr. FAYE, Christiana; Dr. SHERLOCK; Dr. ALDIS; Dr. BAINBRIDGE; Mr. HEATH; Mr. AMESBURY; Mr. DORINGTON; Messrs. LETTIS; Mr. SMITH; Mr. C. THOMPSON; Mr. COFNEY; Mr. RIVERS; REGISTRAR-GENERAL; Dr. BAINES; Mr. OSBORNE; Mr. HALL.

APPOINTMENTS FOR THE WEEK.

December 31, Saturday (this day).

Operations at St. Bartholomew's, 1½ p.m.; St. Thomas's, 1 p.m. King's, 2 p.m.; Charing-Cross, 1 p.m.

ROYAL INSTITUTION, 3 p.m. Professor Faraday "On the Various Forces of Matter."

January 2, Monday.

Operations at the Royal Free Hospital, 1 p.m.; Metropolitan Free Hospital, 2 p.m.

ENTOMOLOGICAL SOCIETY, 8 p.m.

3. Tuesday.

Operations at Guy's, 1 p.m.; Westminster, 2 p.m.

PATHOLOGICAL SOCIETY, 8 p.m. General Meeting for Election of Officers.

ROYAL INSTITUTION, 3 p.m. Professor Faraday "On the Various Forces of Matter."

4. Wednesday.

Operations at University College Hospital, 2 p.m.; St. Mary's, 1 p.m. Orthopædic Hospital, 2 p.m.; Middlesex, 1 p.m.

HUNTERIAN SOCIETY, 7½ p.m. Council Meeting.

GEOLOGICAL SOCIETY, 8 p.m.

PHARMACEUTICAL SOCIETY, 8 p.m.

OBSTETRICAL SOCIETY OF LONDON, 8 p.m. Annual Meeting: Election of Officers.

5. Thursday.

Operations at St. George's, 1 p.m.; Central London Ophthalmic, 1 p.m. London, 1½ p.m.; Great Northern, 2½ p.m.

END OF VOLUME XL.

LONDON :

PRINTED BY CHARLES REED AND BENJAMIN PARDON,
 LOVELL'S-COURT, PATERNOSTER-ROW.

No. 1, 2, 3, is J. Alderman's

Patent Graduating Elastic Couch, shown in different positions: it is fitted with two, three, or four distinct graduating actions, by which an Invalid can be graduated to any position, without being touched by the nurse, and free from all pressure, so that a patient cannot possibly become bedsores by long confinement.

No. 4, 4, is J. A.'s Improved Spinal or general Invalid Couch and Carriage. The couch can be adjusted to any position, and has a shifting stand on easy castors for the room; so that the patient can be lifted with the couch from the stand to the

No. 8, 8, 8, is J. A.'s Patent Portable Equilibrium Carrying Chair, which enables an Invalid to be carried up and down stairs with perfect ease and safety. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 9 is J. A.'s improved Four-wheel Albert Chair, fitted for hand or pony; the body being mounted upon C and under springs both back and front, and has his now wrought-iron perches or cranes, instead of the old-fashioned wood perches. This is the most elegant and easy carriage in use.

No. 10 is J. A.'s improved Three-wheel Brighton Chair, with and without a head, and of the cheapest construction.

carriage without being touched, so as to go out for an airing when required.

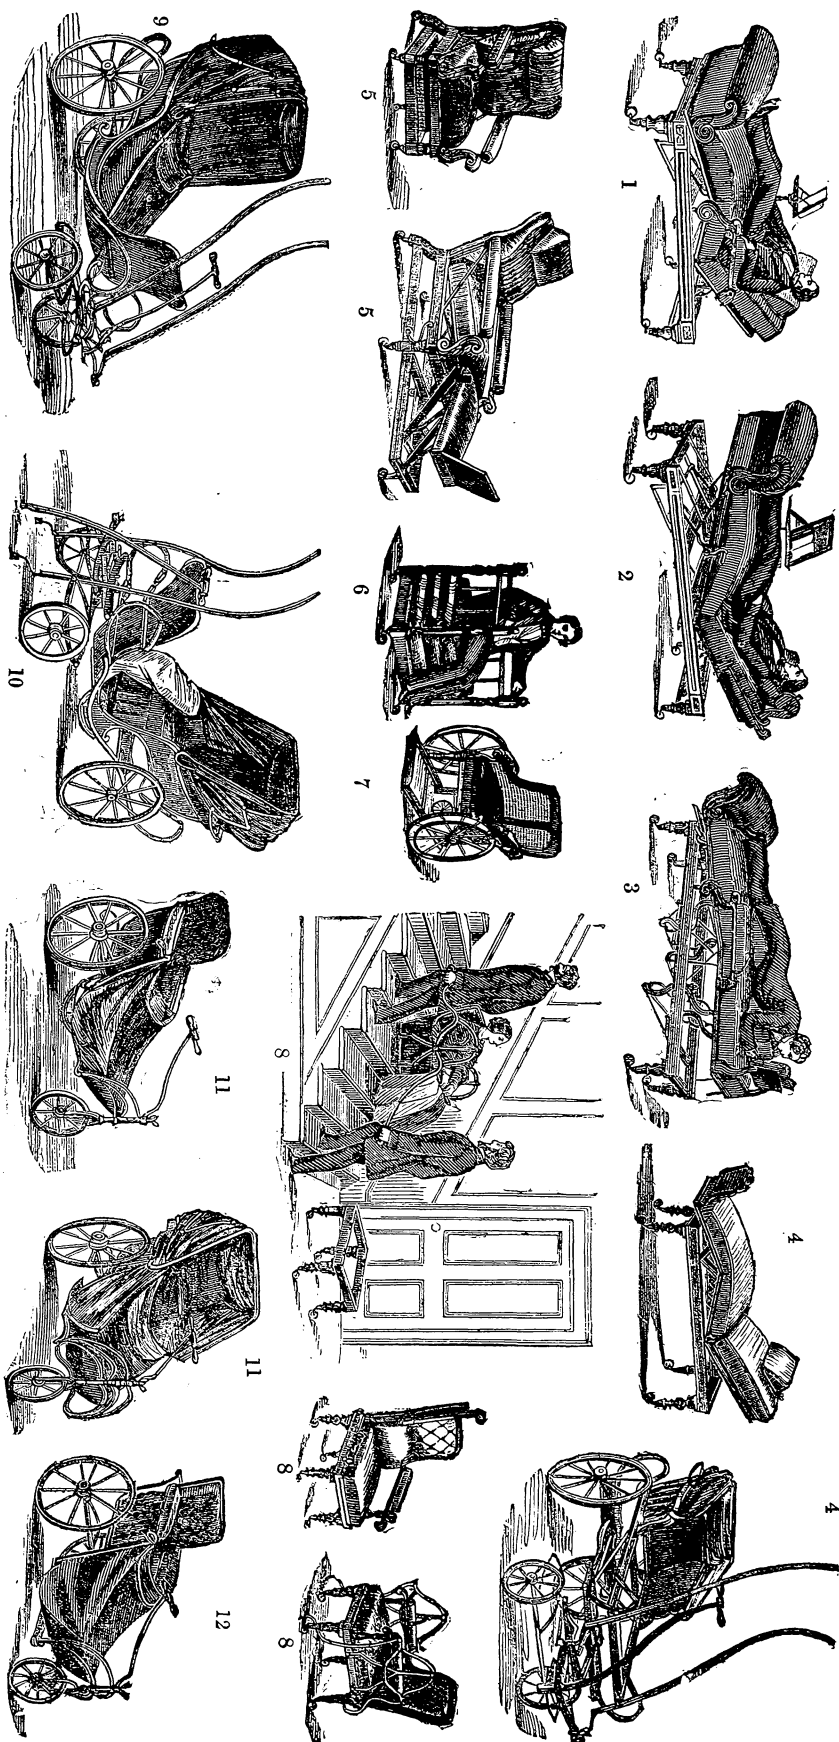

No. 6, 6, is J. A.'s Patent Graduating Elastic Self-adjusting Chair, which, like the couch, is made to follow nature in every respect—the back, the arms, the seat, and leg rest being made to work all together, so that not a muscle of the patient need be disturbed. The arms are also made to put on and off, so that the patient can get on and off from either side while the leg rest is up.

No. 6 is J. A.'s improved Exercising Horse.

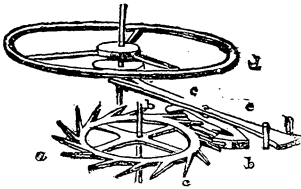

No. 7 is J. A.'s improved Self-propelling Chair, which renders an Invalid perfectly independent, being able to run from room to room without any assistance.

The chair always adjusting itself, enables the two persons who carry it to walk up and down stairs in the usual way, quite erect, with their arms straight down, which avoids any strains upon their muscles. It is also an easy chair for the room when the handles are off, and free from oscillation.

No. 11, 11, is J. A.'s improved Three-wheel Albert Chair, with and without a head, and of the cheapest construction.

LEVER ESCAPEMENT.

Benson's WATCHES.

"Perfection of mechanism."—Morning Post.
Gold 4 to 100 guineas.
Silver 2 to 50 guineas.
Send two stamps for Benson's Illustrated Watch Pamphlet.
Watches sent free to any part of the Kingdom on receipt of a remittance.

33 & 34, LUDGATE-HILL, LONDON, E.C. ESTABLISHED 1749.

BASTICK'S OLEO CUBEKINE.

This Elegant Preparation consists of

the active principles of cubebs—namely, the cubebine and the essential oilen their most effective and least nauseous form. It has been administered with very satisfactory results in gonorrhoea and other diseases where the use of cubebs is indicated. It forms an excellent combination with copaiba balsam. Dose, thirty to sixty minims in an emulsion or floating on water.

Pharmaceutical Laboratory, 2, Brook-street, Bond-street, London.

Varicose Veins and Supporting Bands.

—SURGICAL ELASTIC STOCKINGS AND KNEE CAPS, pervious, light in texture, and inexpensive, yielding an efficient and unvarying support, without the trouble of lacing. Likewise, a strong low-priced article for Hospitals and the Working-Classes. ABDOMINAL SUPPORTING BANDS for both Sexes; those for Ladies' use, before and after accouchement, are admirably adapted for giving adequate support with extreme lightness—a point little attended to in the comparatively clumsy contrivances and fabrics hitherto employed. Instruction for measurement and prices on application, and the articles sent by post from the Manufacturers and Inventors, POPE and PLANTE, 4, Waterloo-place, Pall-mall, London, S.W.

The Profession, Trade, and Hospitals, supplied.

H. Silverlock's Medical Label Ware—

HOUSE, Letter-Press, Copper-plate, and Lithographic Printing Offices, Wardrobe-terrace, Doctors'-commons, London, E.C.

H. SILVERLOCK'S stock of Labels for Dispensing purposes having been recently revised and enlarged, now consists of upwards of 800 different kinds. Yellow and Green Labels for Drug Bottles, Drawers, &c., at per book or dozen: a Book, containing a selection in general use in Surgeries or Dispensaries, 10s. 6d. Priced Catalogues of the above may be had, post free, on application. Printing of every Description at Moderate Prices.

To Surgeons, Dentists, etc.—The Best

HOUSE in London for SECOND-HAND INSTRUMENTS is Mr. WM. LAWLEY'S, Lombard House, 78, Farringdon-street, City.

Established upwards of a Century.

A large Stock of New Instruments always on Sale, all Warranted.

Instruments Bought, Sold, or Exchanged.

N.B.—The largest Stock of Second-hand Dissecting Cases in London.

Mr. Jones' Elastic Uterine Truss.—

This Truss combines in its construction strength, lightness, and elasticity, is easy to wear, and efficient in its application. It affords great relief in cases of Uterine Pain, often occurring from relaxation in delicate females, and is of inestimable value in all cases of Prolapsus Uteri, rendering the use of pessaries entirely unnecessary.

N.B. Apply to the Inventor, Mr. Jones, Surgeon, 43, Friargate, Derby, or to Messrs. Longdon and Co., Wholesale Manufacturers, Derby.

W. Twinberrow begs to draw the

attention of the Medical Profession to his EXTRACT of INDIAN HEMP, prepared expressly for him at Calcutta, its peculiar sedative properties being so beneficial where opiates are inadmissible. Also to his MEDICINAL EXTRACTS, prepared from the fresh plants (Hyoscyamus Niger, Conium Maculatum, Atropo, Belladonna, Cotyledon Umbilicus, etc.) Also to his Liq. Taraxici, Liq. Galli Aparinis (a valuable alternative), Liq. Parietarie (diuretic), and Liq. Belce (prepared from the Egle Marmelos, or Indian Bael), for dysentery and diarrhoea. W. T. has a large supply of INDIAN BAEL on hand. 2, Edwards-street, Portman-square.

BOUDAULT'S PEPSINE imported in original bottles. *Ext. Laricis Europ.*

POULTICES SUPERSEDED! SPONGIO PILINE.

The Profession are respectfully

informed, that the WANDLE FELT COMPANY having purchased Mr. MARKWICK'S PATENT for the well-known SPONGIO PILINE, for the application of moist heat, in lieu of Poultices and Fomentations, and the IMPERMEABLE PILINE, for Rheumatism, for promoting perspiration, and for the application of stimulating liniments, are now supplying these articles, of superior manufacture, and at greatly reduced prices, at 27, BEDFORDBURY, COVENT-GARDEN, London, and also through the Wholesale and Retail Druggists in town and country.

PURE SPIRITS FOR THE FACULTY.

S. V. R. 56 o.p., 17s. net Cash.—

This quotation admits of neither credit nor discount, and 1s. per gallon must be added for packages, to be allowed on their return.

HENRY BRETT and CO., Old Fumival's Distillery, Holborn.

Students' Achromatic Microscopes,

Complete at £3 3s. C. BAKER, of 243 and 244, High Holborn, begs to inform the Medical Profession that from the introduction of improved machinery he is now enabled to supply the cheapest and most useful Medical Microscope ever manufactured; they are fitted up complete with three beautifully-defining Achromatic Object-Glasses, that are capable of showing in a very superior manner all the usual Physiological Objects quite equal to the more expensive kind. Catalogues free by post.

Dr. Caplin's Electro-Chemical Bath

ESTABLISHMENT, 9, YORK PLACE, BAKER STREET, PORTMAN SQUARE, for the extraction of Mercury, and other Metallic or Extraneous Substances, and the Treatment of Chronic Diseases. For the demonstration of this new system, vide the Second Edition, price 1s., 8vo, of Dr. Caplin's Treatise on the Electro-Chemical Bath, and the Relation of Electricity to the Phenomena of Life, Health, and Disease. Sold at the Author's Establishment.

Superphosphate of Iron and Super-

PHOSPHATE of IRON and LIME. New Remedial Agents introduced to the notice of the Profession at the Meetings of the Medical Society of London, and now extensively employed by the most eminent members of the Medical Profession. The Syrup is the most eligible mode of administering these valuable Remedial Agents. Mr. GREENISH will be happy to forward a variety of cases which have been furnished to him, where its success has been most marked, and which will serve to indicate where it may be most advantageously employed.—20, New-street, Dorset-square.

DR. DE JONGH'S (Knight of the Order of Leopold of Belgium) LIGHT-BROWN COD-LIVER OIL.

OPINION OF

EDWIN LANKESTER, Esq., M.D., LL.D., F.R.S.,*Late Lecturer on the Practice of Physic at St. George's Medical School, Superintendent of the Food Collection at the South Kensington Museum, &c. &c.*

"I have much pleasure in bearing testimony to the excellent qualities of the Cod-liver Oil prepared under the superintendence of Dr. De JONGH, of the Hague. "I believe that the purity and genuineness of this Oil are secured in its preparation by the personal attention of so good a Chemist and intelligent a Physician as Dr. De JONGH. He was the first Chemist who gave an accurate analysis of the Cod-liver Oil, and the discoverer of an organic substance which it contains.

He has also written the best Medical treatise on the Oil with which I am acquainted. Hence I should deem the Cod-liver Oil sold under his guarantee to be preferable to any other kind as regard genuineness and medicinal efficacy.—S, Savile-row, W., August 1st, 1859."

SOLE CONSIGNEES AND AGENTS,

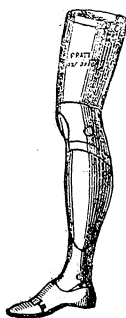

ANSAR, HARFORD, & CO., 77, Strand, London, W.C.**WALTERS' INDIA-RUBBER URINALS.**

F. WALTERS having originally invented these Urinals, begs to warn the Profession of the many bad and useless imitations which are now sold, and he would advise them, before purchasing, to look that they are stamped with his name; as, unless that be the case, he cannot guarantee them.

These conveniences are made for those who require them only occasionally, during a long journey, as well as for those invalids who use them always. MR. WALTERS has much improved them by making them of *Etherised India-Rubber*, which adds very greatly to the strength of the India-Rubber, at the same time that it prevents its sticking together; by this means he is enabled to make them less stiff and harsh than hitherto, and yet to retain all the advantages of that stiffness. There is a patent valve, which prevents the return of the fluid; and they may be worn either sitting, walking, or lying, without the slightest inconvenience, and without being perceived by any one.

WALTERS' CONVENIENCES FOR LADIES will be found particularly useful during pregnancy. They are perfectly soft and flexible, and may be worn with perfect comfort.

All Orders must be accompanied by a Post-office order or reference.—Entrance for Ladies at the private door, where a Female attends.

MANUFACTURER OF ELASTIC STOCKINGS, BELTS, &c.**16, MOORGATE STREET, NEAR THE BANK, LONDON. E.C.****Pratt's Artificial Leg.**

J. PRATT begs to call the attention of the Profession to the following Testimonial, just received:—

"Somerset,

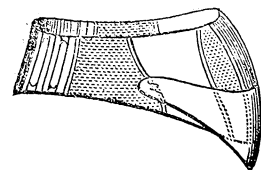

June 20th, 1858.

"DEAR SIR,—It affords me much pleasure in being able to state that the Artificial Leg which you supplied me with is far beyond my best anticipations. From its being so LIGHT IN WEIGHT, and its action in the foot so natural, I can walk, or ride on horseback, with ease and comfort; and few indeed would detect it as being other than natural. It has given me full satisfaction.

I am, dear Sir, yours very truly,
J. W.

To Mr. J. Pratt,
Surgical Instrument Maker,
420, Oxford-street."

J. & E. BRADSHAW, late

Shoolbred and Bradshaw, 34, Jermyn-STREET,

beg to call attention to the various improvements in PATENT ELASTIC STOCKINGS, BELTS, KNEE-CAPS, SOCKS, and Ladies' and Gentlemen's SPINE-SUPPORTERS. A new description of BELT invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c. —N.B. Every description of INDIA-RUBBER BANDAGE, vulcanized on the newest principle.

Directions for measurement sent by post. N.B. A liberal Discount to the Profession.

A Female to attend on Ladies.

Williams and Son's Pure Glycerine

PELLATT & Co.,

FALCON GLASS WORKS, LONDON.

Crosse and Blackwell, Purveyors in

Ordinary to Her Majesty, respectfully invite attention to their PICKLES, Sauces, Tart Fruits, and other table delicacies, the whole of which are prepared with the most scrupulous attention to wholesomeness and purity. The practice of colouring pickles and tart-fruits by artificial means has been discontinued, and the whole of their manufactures are so prepared that they are not allowed to come in contact with any deleterious ingredient. A few of the articles most highly recommended are, Pickles and Tart Fruits of every description, Royal Table Sauce, Essence of Shrimps, Soho Sauce, Essence of Anchovies, Jams, Jellies, Orange Marmalade, Anchovy and Bloaters Pastes, Strasbourg and other Potted Meats, and Cal's-Foot Jellies of various kinds for table use. C. and B. are also sole agents for M. Soyer's Sauces, Relish, and Aromatic Mustard; and for Carstairs' Sir Robert Peel's Sauce, and Payne's Royal Osborne Sauce. The above may be obtained of most respectable Sauce Vendors throughout the United Kingdom; and Wholesale of

CROSSE and BLACKWELL, 21, Soho-square.

ESTABLISHED A.D. 1823.

Obstetrical Society of London.—The

Annual Meeting of the Obstetrical Society of London, will be held on WEDNESDAY, JANUARY 4th next, at Eight o'clock, p.m. At the Meeting in question, certain proposed alterations of the Laws of the Society will be considered; a ballot for the Election of Officers and other Members of the Council, for the year 1860, will take place; the Report of the Audit Committee will be read, and the President will deliver the Annual Address.

GRAILY HEWITT, M.D., } Hon. Secs.
T. H. TANNER, M.D.

53, Berners-street, W., December 26th, 1859.

University of London.—The

Institution of the Degrees of BACHELOR of SCIENCE (B.Sc.) and DOCTOR of SCIENCE (D.Sc.) having been decided on by the Senate and approved by Her Majesty's Government, the Regulations relating to the First and Second Examinations for the B.Sc. Degree, and to the Examination for the D.Sc. Degree may be obtained on application to the Registrar.

Bachelors of Arts of this University, and Undergraduates who have passed its First M.B. Examination, will be admitted to the Degree of Bachelor of Science on passing the Second B.Sc. Examination only.

The Revised Regulations relating to DEGREES in ARTS may also be obtained on application to the Registrar.

WILLIAM B. CARPENTER, M.D., Registrar.

Burlington House, London, W., December 22, 1859.

Mental Disorders.—Wye House,

BUXTON, DERBYSHIRE.—PRIVATE ESTABLISHMENT for the Care and Treatment of a select and limited number of persons Mentally affected.

Resident Proprietor—T. DICKSON, L.R.S.C.E.,

Late Medical Superintendent of the Manchester Lunatic Hospital. Wye House is delightfully situated in its own grounds of twelve acres at Buxton, and forms part of the magnificent scenery of Wye Dale. The well-known salubrity of Buxton, and the hygienic effects of its waters and baths, renders it a desirable locality for Invalids Nervously or Mentally affected. Ample means are provided for the occupation and amusement of the Patients, including carriage and garden exercise.

Ringwood Union, Hants.—Wanted, a

MEDICAL OFFICER for District No. 1. The Salary (exclusive of 10s. for Midwifery cases in the town, and 15s. one mile beyond Ringwood Church, and fees for surgical cases) is £55 per annum. The district comprises a population of 3548, and an area of about 5574 acres. The usual conditions and engagements, as to Medicines, returns, and attendances, &c., will be inserted in the contract. The successful candidate will be appointed Vaccinator for the same District. The Election is fixed for MONDAY, the 9th day of January, 1860, at Two o'clock, p.m. Written Applications, with Testimonials, must be left with, or addressed to, the clerk, so as to be received before 12 o'clock of the said day.

Ringwood, December 27, 1859. HENRY ST. JOHN NEALE, Clerk.

Medical Transfer and Partnership.

30, Bucklersbury, Cheapside.

Mr. Orridge, Medical Transfer Agent,

Referee, and Valuer of Medical Property, may be consulted, at the above Address, by Gentlemen about to receive PARTNERS, or to RELINQUISH or to COMMENCE Practice.

Mr. Orridge is known to many of the Hospital Physicians and Surgeons of London.

He has been concerned professionally for a considerable proportion of the most influential Practitioners (including Partners in many of the leading Medical Firms), to whom he has the satisfaction of being permitted to refer—a privilege that he trusts will be regarded as a proof of the sincerity of his endeavours to conduct these transactions in an honourable and straightforward manner.

Gentlemen desirous of obtaining Mr. Orridge's opinion, or requiring his attendance professionally in any part of England, can obtain terms on application, by (confidentially) transmitting name and address.

Office Hours, from Eleven to Four.

Medical Pupil.—The Visiting Surgeon

to the Worcester Dispensary, has a VACANCY for a PUPIL. For particulars, apply to Mr. Woodward, 25, Foregate-street, Worcester.

Medical Practice, For Immediate Sale,

in a rural district. Premium £500, receipts during this year, £215, amount of book debts upwards of £600. House rent and working expenses, very moderate. For particulars, address C. I., Medical Times and Gazette Office, New Burlington-street, W.

To Parents and Guardians.—There is

a Vacancy for a Gentlemanly Youth, as PUPIL, in a very old Established Suburban Practice. Every opportunity will be afforded for him to acquire proficiency in Professional knowledge. One who intends reading for London University Examinations preferred. Apply, F. Bury, Esq., Middlesex Hospital, London, W.

An Elderly Country Practitioner is in

immediate want of a Fully Qualified and Competent ASSISTANT; and to an Eligible Gentleman, possessing capital, ulterior prospects seldom offered. The highest references given and required. Address, Sigma, the Medical Times and Gazette Office, 11, New Burlington-street, London, W.

A Married Gentleman, without Family,

aged Thirty, "sine diploma" but with Fifteen Years' Active Experience in Town and Country, will be shortly OPEN to an ASSISTANTSHIP, or to take charge of a BRANCH PRACTICE or RETAIL ESTABLISHMENT. Liberal Terms required. Address, U. U., Higham Ferrers, Northamptonshire.

Wanted, by a Medical Practitioner

in a Provincial Town, fifty miles from London, a QUALIFIED ASSISTANT, to visit and do part of the Dispensing. A light weight, and accustomed to horse-back indispensable. Apply to Warner and Barclay, 55, Fore-street, Finsbury.

Royal London Ophthalmic Hospital,

BLOMFIELD-STREET, MOORFIELDS.

A Three Months' COURSE OF LECTURES on OPHTHALMIC SURGERY, in compliance with the recent Regulations of the Army Medical Department, will be given at this Hospital by Messrs. CRITCHETT and BOWMAN. The Lectures will commence on January 10, at Half-past Ten o'clock, and be delivered every Tuesday and Friday at this hour. Fee for One Year's Hospital Attendance, including Lectures, Five Guineas. Students already entered will be admitted without further fee. Medical Men in the public service will be admitted on presenting their cards.

CAUTION.

Chlorodyne.—Any Preparation adver-

tised or sold under the name of Chlorodyne, other than Dr. J. COLLIS BROWNE'S, is not that recognised and prescribed by the Profession, for which so great and valuable testimony is accorded, as published in the Medical Journals.

Dr. J. COLLIS BROWNE'S Chlorodyne is the only genuine, he having alone discovered and named this new agent, and confided its manufacture absolutely, solely, and entirely, to

J. T. DAVENPORT, Pharmacist, 33, Great Russell-street, Bloomsbury, London.

N.B.—Medical men are earnestly solicited to attach the words "Dr. J. Collis Browne's Chlorodyne" when prescribing, also to observe that the signature of Dr. J. Collis Browne, in white letters on a red ground, is outside each bottle.

The spurious compounds sold under the name of Chlorodyne not only invariably fail to produce the extraordinary beneficial effects accorded to the genuine, but often occasion most serious results, and being a remedy so often resorted to in extreme cases, the life of the patient, and the credit of the Practitioner are at stake. The active principle of Chlorodyne has never been publicly intimated, its effects are quite dissimilar to opium or its salts. It relieves pain in any organ and from whatever cause. Spurious compounds will be sure to disappoint. Dr. J. Collis Browne's Chlorodyne is the only genuine.

London: Printed by CHARLES REED and BENJAMIN PARDON, o 1, 2, and 3, Lovell's-court, Paternoster-row, in the City of London, and Published by JOHN CHURCHILL, at the Publishing Office, No. 11, New Burlington-street, in the Parish of St. James, in the City of Westminster.—December 31, 1859.
